

# Object-attribute data: from philosophy to visualization through mathematics and programming

Speaker: Alexey Neznanov

Senior Data Scientist, SMR Center & Digital Development, Schlumberger

2025-01-28

V. 0.09.01

# About the speaker

- Alexey Neznanov
  - PhD, IEEE member
  - Senior Data Scientist at Schlumberger
  - Senior Researcher at International laboratory of Intelligent systems and structural analysis (<http://cs.hse.ru/ai/issa>)
  - «Small Guide to Big Data» consultant at PostScience portal ([http://postnauka.ru/author/a\\_neznanov](http://postnauka.ru/author/a_neznanov))
  - Author of textbook, instructional guidelines, 11 courses, and more than 65 research papers

# Some discussed terms

- Entity and concept
- Object and class
- Attribute and attribute value
- Measure, scale, and unit of measure
- Relation and relationship
- Tuple and record
- Type and format
- Interface and protocol
- Table, pivot table, and dataframe
- Machine learning, datasets and features
- DataViz

!! Data and metadata → in **other** presentation

# Basic sources

- Logic and set theory

# Object-attribute data (tables?)

- **Object** – an instance of some entity
- **Attribute** – a description of an attribute of some entity
- **Attribute value** (assembled into a **tuple**)
  - Hence, the “relational algebra” on tuples
- Traditional representation as a table:
  - No column/row ordering!!!

Objects

	Attribute 1	...	Attribute M
Object 1	348	...	451
...	...	Value	...
Object N	123	...	234

Attributes

Values

# Attribute synonyms

- Accent
- Aspect
- **Attribute**
- Characteristic
- **Condition**
- Connotation
- Degree
- Distinctor (distinction)
- Facet
- **Feature**
- Genus
- Indicator (indication)
- Inherent
- **Kind**
- Mark
- Peculiarity
- **Predicate**
- **Property**
- Quality
- Quirk
- Score
- Sign
- Status
- Symptom
- **Trait**
- **Type**
- Variety

# FANTASTIC ENTITIES AND WHERE TO FIND THEM

- ✓ Semiotics and sign systems
- ✓ Entities and concepts
- ✓ Hermeneutic circle, natural language as a language of philosophy
- ✓ Ontology, epistemology, gnoseology
- ✓ Grounding
- ✓ Measurements and scales

# Semiotics and sign system

- **Sign system** – any system of signs and relations between signs
  - Sign system – algebraic system intended to capture the systematic structure of complex signs, since in all but the simplest cases, most signs are composed from other signs
    - Goguen J.A. Semiotic Morphisms. 2004
  - Semiotics for Beginners (<https://www.cs.princeton.edu/~chazelle/courses/BIB/semio2.htm>)

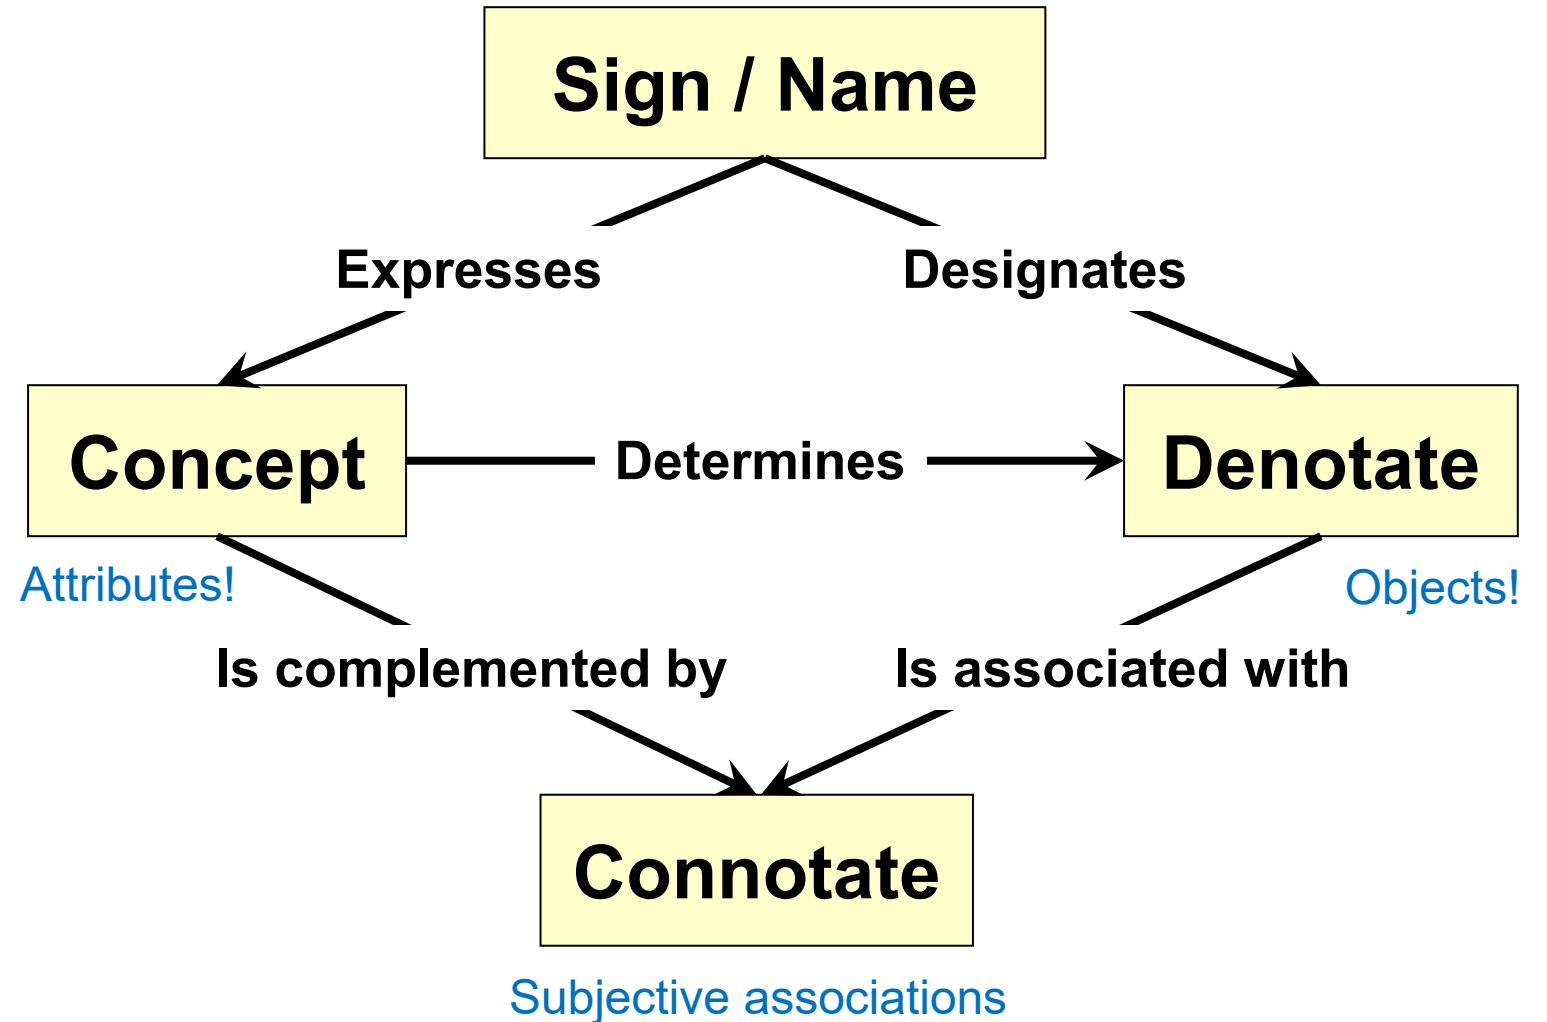

- We interpret things as signs largely unconsciously by relating them to familiar systems of conventions!
  - **Codes** for messages transmission
    - **Encoding** is the process of creating a message for transmission by an addresser (sender) to an addressee (receiver)
    - **Decoding** is the process of interpreting a message sent by an addresser (sender) to an addressee (receiver)

# Frege triangle – most popular model of “sign”

- F.L.G. Frege, 1848-1925
- Basic triangle + connotations:

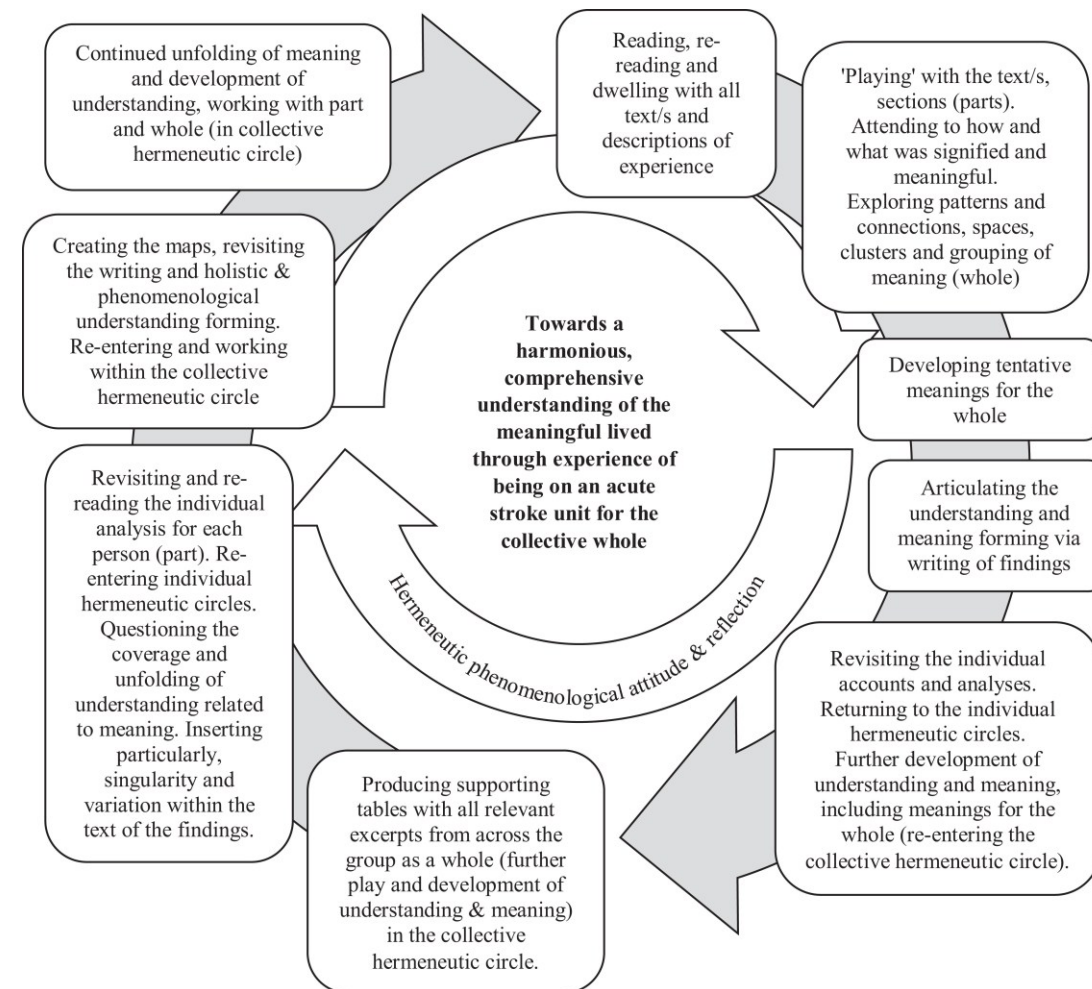

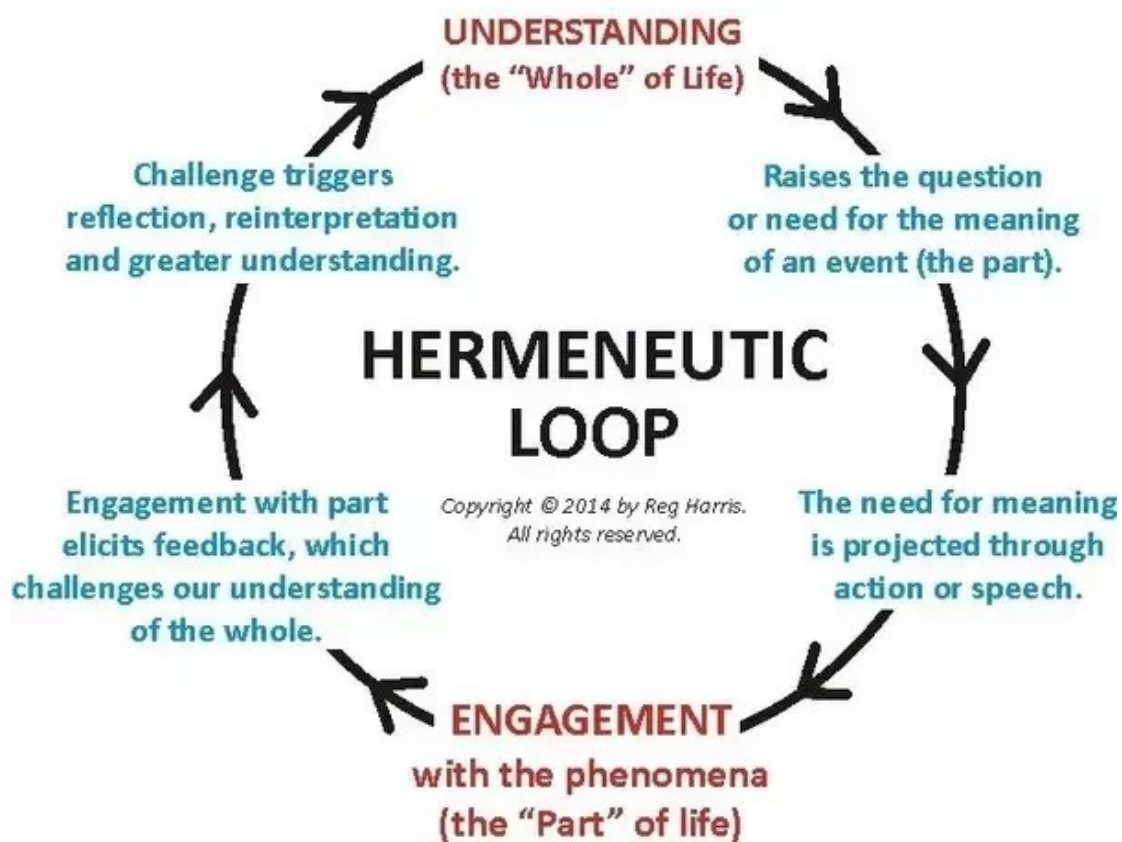

# Semiotics deconstruction: semantics, syntactics, and pragmatics

- Three points of view (the branches of semiotics):
  - **Semantics** – this is the “how” of semiotics, and is concerned with this relationship between a signified and signifier – the sign and what it stands in for
  - **Syntactics** – this refers to structural relations in the set of signs
    - One structural relation in language is **grammar**, but syntactics in semiotics refers to the formal relationship between signs that lets them build into sign systems
  - **Pragmatics** – according to Morris, is the relationship of sign to the person reading or understanding that sign
    - Morris C. Foundations of the Theory of Signs (in International Encyclopaedia of Unified Science, V.1). University of Chicago Press, 1938. 59 p.
- “The **syntactic** and **semantic** structure of natural languages evidently offers many mysteries, both of fact and of principle, and any attempt to delimit these domains must certainly be quite tentative”
  - Chomsky N. Aspects of the Theory of Syntax. MIT Press, 1965. 261 p.

# Hermeneutics

- Hermeneutic loop/circle
  - Martin Heidegger – Being and Time, 1927

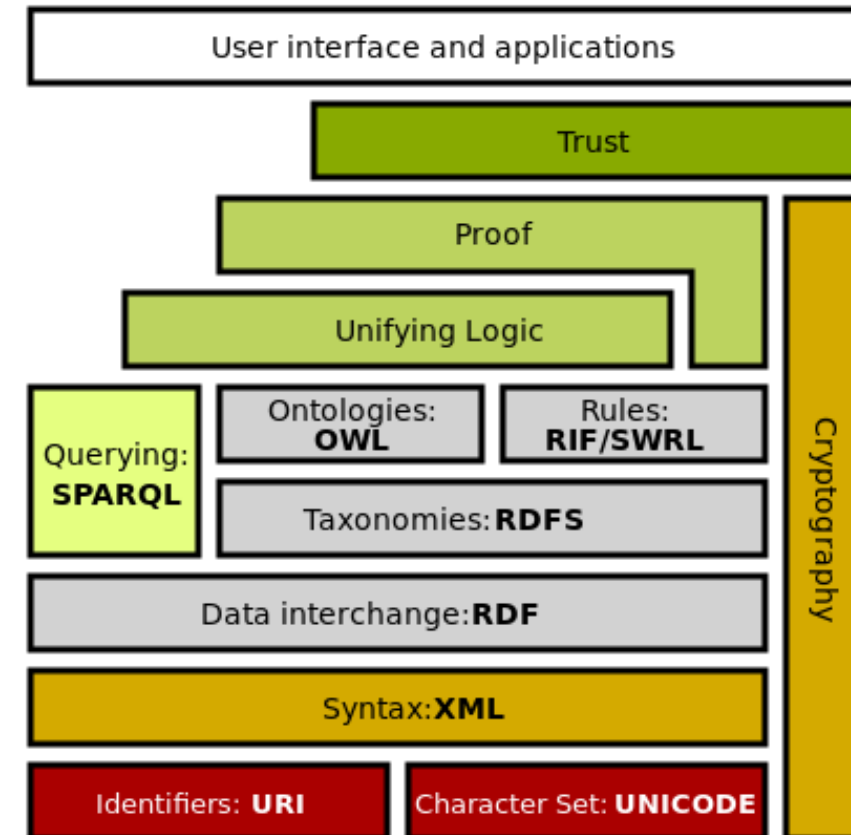

# Hermeneutic circle in practice

- From “Basic Formal Ontology 2.0 – Specification and User’s Guide” (<http://github.com/BFO-ontology/BFO/raw/master/docs/bfo2-reference/BFO2-Reference.pdf>):
  - “... we distinguish between **primitive** and **defined**. ‘Entity’ is an example of one such primitive term.
  - Primitive terms in a highest-level ontology such as BFO are terms that are so basic to our BFO 2.0 Specification and User’s Guide understanding of reality that there is **no way** of defining them in a **non-circular fashion**.
  - For these, therefore, we can provide only **elucidations**, supplemented by **examples** and by **axioms**”
- Fuenmayor D., Benz Müller C. A Computational-Hermeneutic Approach for Conceptual Explication. arXiv:1906.06582, 2019 (<http://arxiv.org/abs/1906.06582>)
  - !!!

# Ontology (+ontics), epistemology, gnoseology

- Technical ontology – formalized computer-readable domain knowledge
- T. Gruber, 1993:  
“**Explicit specification of a conceptualization**”
  - The most cited definition!
  - + “**Shared**”
- **Semantic Web** (<http://www.w3.org/standards/semanticweb/>)
  - XML (<http://www.w3.org/XML/>)
  - RDF (<http://www.w3.org/RDF/>)
  - OWL (<http://www.w3.org/OWL/>)
  - SPARQL (<http://www.w3.org/TR/sparql11-overview/>)
  - +++

# An introduction to ontology engineering

- Keet M. An introduction to ontology engineering. 2020 (<https://people.cs.uct.ac.za/~mkeet/OEbook/>)
  - The best introduction
  
- Allemang D., Hendler J. Semantic Web for the Working Ontologist: Effective Modeling in RDFS and OWL. 2<sup>nd</sup> Ed. Morgan Kaufmann, 2011. 384 p.

# The problem of definitions

- Different **domains** → different **languages** → different **conceptualizations**
  - **Vocabulary**: the body of words used in a particular language
  - **Glossary**: link terms to concepts, described informally by **glosses**
  - **Thesaurus**: add structural (semantic) relationships among terms (and concepts), i.e. generalization, part, dependence, causation, ...
- Michie S., West R., Hastings J. Creating ontological definitions for use in science. 2022 (<http://www.qeios.com/read/YGIF9B>)
  - Vocabulary definitions are often ambiguous or circular
  - We try to use **constructive distinctive non-circular** definitions!
- Bjørner D. Domain Science and Engineering. Springer, 2021. 401 p.

# Ontologies in various scientific fields

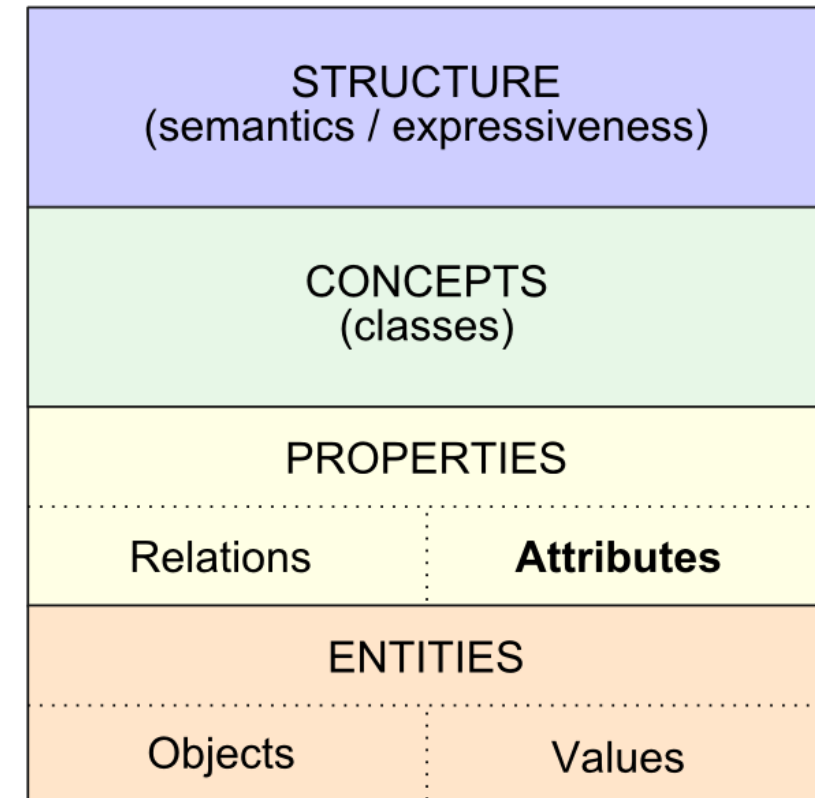

- Interdisciplinary discussions!
- Busse J., Humm B., Lubbert C., Moelter F., Reibold A., Rewald M., Schlüter V., Seiler B., Tegtmeier E., Zeh T. **Actually, What Does “Ontology” Mean?** A Term Coined by Philosophy in the Light of Different Scientific Disciplines / Journal of Computing and Information Technology. 23(29), 2015.
  - Participants:
    - Philosopher
    - Psychologist
    - Information scientist

Philosophy	Computer Science
Substance	Class, entity, concept
Accidents	Attribute, property
Fact	Fact, statement, proposition, relation
Ontology	Base-ontology, foundational ontology

# Main question: attribute or relationship?

- Attribute as value object and as reference
- Depends on:
  - Abstraction level
  - Level of specification details
  - Data access layer
- Attribute does not have Identifier, instead it is stored directly as some datatyped variable inside entity
  - Conceptual and Practical Distinctions in the Attributes Ontology (<https://www.mkbergman.com/1842/conceptual-and-practical-distinctions-in-the-attributes-ontology/>)

# Interesting case of standardization of terminology

- ISO 5127:2017 Information and documentation — Foundation and vocabulary (<http://www.iso.org/obp/ui#iso:std:iso:5127:ed-2:v1:en>)

## 3.1.1.01 – object

anything perceivable or conceivable

Note 1 to entry: *Objects* may be material (e.g. an engine, a sheet of paper, a diamond), immaterial (e.g. conversion ratio, a project plan) or imagined (e.g. a unicorn).

[SOURCE:ISO 1087-1:2000, definition 3.1.1]

Note 2 to entry: See also [“entity” \(3.1.13.27\)](#); and [ISO/IEC 27000:2016, definition 2.55](#).

## 3.1.1.60 – material object

physical object

[object \(3.1.1.01\)](#) which has physical extension in space and time

Note 1 to entry: See also [“naturafact” \(3.2.1.01\)](#), [“artefact \(1\) <man-made object> \(3.2.1.02\)](#); [ISO 21127:2014](#), classes “E 18” and “E 19”.

## 3.1.1.03 – property

distinguishing feature of a [material object \(3.1.1.60\)](#)

[SOURCE:<http://iso.i-term.dk/login.php>, modified]

Note 1 to entry: See also [ISO 21127:2014, definition 3.14](#).

## 3.1.1.02 – concept

unit of [knowledge \(3.1.1.17\)](#) created by a unique combination of [characteristics \(3.1.1.04\)](#)

Note 1 to entry: *Concepts* are not necessarily bound to particular languages. They are, however, influenced by the social or cultural background, which often leads to different categorizations.

[SOURCE:ISO 1087-1:2000, definition 3.2.10]

Note 2 to entry: *Concepts* represent [objects \(3.1.1.01\)](#).

Note 3 to entry: See also [ISO 25964-1:2011, definition 2.11](#).

Note 4 to entry: See also [“class” \(3.8.5.03\)](#), [“conceptual object” \(3.1.1.61\)](#), [“mentefact” \(3.2.1.03\)](#).

## 3.1.1.61 – conceptual object

[object \(3.1.1.01\)](#) which is the product of the mental activity of applying abstraction in human mind activities

Note 1 to entry: See also [ISO 21127:2014](#), classes “E 28” and “E 65”.

## 3.1.1.04 – characteristic

abstraction of a [property \(3.1.1.03\)](#) of an [object \(3.1.1.01\)](#) or of a [set \(3.1.1.09\)](#) of objects

Note 1 to entry: Characteristics are used for describing [concepts \(3.1.1.02\)](#).

[SOURCE:ISO 1087-1:2000, definition 3.2.4]

# Some comparisons of terminology differences

UMBEL/AO Terminology	Terminology Used Elsewhere	
Entity type	concept kind set	collection type class
Entity	object instance exemplar element	member record individual dependent variable
Attribute	property predicate relationship feature facet	dimension characteristic field header independent variables

# Conceiving and understanding: concepts and meanings

- Seiler T.B. **Begreifen und Verstehen**: ein Buch über Begriffe und Bedeutungen. Darmstädter Schriften zur allgemeinen Wissenschaft. Verlag Allgemeine Wissenschaft, Mühlthal, 2001.
  - Seiler discusses a great variety of concept theories in philosophy and psychology and concludes with his own theory which extends the concept understanding of Piaget's **structure-genetic approach**
  - In his theory, Seiler describes concepts as cognitive structures whose development in human mind is **constructive** and **adaptive**
  - Twelve aspects!
    - They are briefly described in the following twelve subsections and used to review the adequacy of the mathematizations of FCA
    - In each subsection, the first paragraph concisely summarizes Seiler's understanding of the corresponding aspect; then related notions and relationships from FCA are discussed and partly concretized by at least one example. The connections between Seiler's concept theory and FCA which come apparent in this way are far from being exhaustive. But they already show an astonishing multitude of correspondences between both theories which may be taken as arguments for the adequacy of the discussed mathematizations

# Controlled language and semantic relations

- Andries van Renssen A. **Taxonomic Dictionary of Relations**, 2016

(<http://www.lulu.com/shop/andries-van-renssen/taxonomic-dictionary-of-relations/paperback/product-22534783.html>)

- This is a taxonomic dictionary, which means that the defined concepts are arranged in a strict subtype-supertype hierarchy, also called a *taxonomy*
- The dictionary defines kinds of relations that are usually not found in conventional dictionaries.
  - A number of the kinds of relations are also defined in various ISO and non-ISO standards
- More than **5000** relations!

- Implementation in Gellish:

- Gellish Syntax and Contextual Facts

(<http://github.com/AndriesSHP/Gellish/blob/master/Data/Gellish%20Syntax%20and%20Contextual%20Facts%20-%20Oct2017.pdf>)

# Main classes of relations

- Entities are linked together in “relations”, at the level of both instances (individuals) and types (classes)
- Three groups of relations are distinguished

Examples from BFO reference

## 1. Instance-level relations:

- Your heart (instance-level) **continuant\_part\_of** your body at t
  - **Boldface** indicates a label for an **instance-level** relation!
- Your heart beating (instance-level) **has\_participant** your heart

## 2. Type-level relations:

- human heart **continuant\_part\_of** human body
- human heart beating process **has\_occurent\_part** beat profile

## 3. Instance-type relations:

- John's heart *instance\_of* human heart

# Mereology and holararchy

- Parthood relations (or part-whole relationships)
- The axioms of **Minimal Extensional Mereology** (Simons P. Parts: A study in ontology. Clarendon Press, 1987):
  - **Antisymmetry**: If  $x$  part of  $y$ , then if  $y$  part of  $x$ , then  $x = y$ .
  - **Transitivity**: If  $x$  part of  $y$ , and  $y$  part\_of  $z$ , then  $x$  **part\_of**  $z$ .
  - **Weak Supplementation**: If  $x$  **part\_of**  $y$  & not  $x = y$ , then there is some  $z$  such that ( $z$  **part\_of**  $y$  and  $z$  has no part in common with  $x$ ).
  - **Unique Product**: If  $x$  and  $y$  have a part in common, then there is some unique  $z$  such that for all  $w$  ( $w$  is part of  $z$  if and only if ( $w$  is part of  $x$  and  $w$  is part of  $y$ )).
  - Additional relation “proper\_part\_of” is defined as  $x$  **proper\_part\_of**  $y \equiv x$  **part\_of**  $y$  & not  $x = y$
- For us more important: Barton A., Toyoshima F., Vieu L., Fabry P., Ethier J.-F. The **Mereological Structure of Informational Entities**. Formal Ontology in Information Systems // 11th International Conference (FOIS 2020), pp.201-215, 2020 (<http://hal.science/hal-03041523/document>)
- **Holararchy** is a system of organization where entities, called holons, are both self-contained wholes and parts of larger wholes

# Why we need ontology?

- We need to talk formally about domains:
  - Human ↔ Human
  - Computer ↔ Computer
  - Human ↔ Computer
- Applications:
  - Knowledge representation
  - Knowledge exchange and merging
  - Knowledge bases construction
  - Logic reasoning
  - Explanation of decisions
  - Knowledge gaps detection
- *Statistical Machine Learning* is a tool to “guessing” an answer
  - We need interpretation, explanation, harmonization, and tutoring!

© 2021 <https://blog.metaphacts.com/visual-ontology-modeling-for-domain-experts-and-business-users-with-metaphactory>

# Natural languages in the land of LLMs

- Problem: context, discourse, narrative
  - Remember “literary criticism” as a humans’ activity!
- Pirozelli P., Câmara I. Natural Language at a Crossroads: Formal and Probabilistic Approaches in Philosophy And Computer Science. Manuscrpto, 45(2), 2022  
(<http://www.scielo.br/j/man/a/8CcCj7HdRDXmmyZXpPZFp7t/>)
- Vulich R. Frege’s Sharpness Requirement and Natural Language  
(<http://cah.ucf.edu/fpr/article/freges-sharpness-requirement-and-natural-language/>)

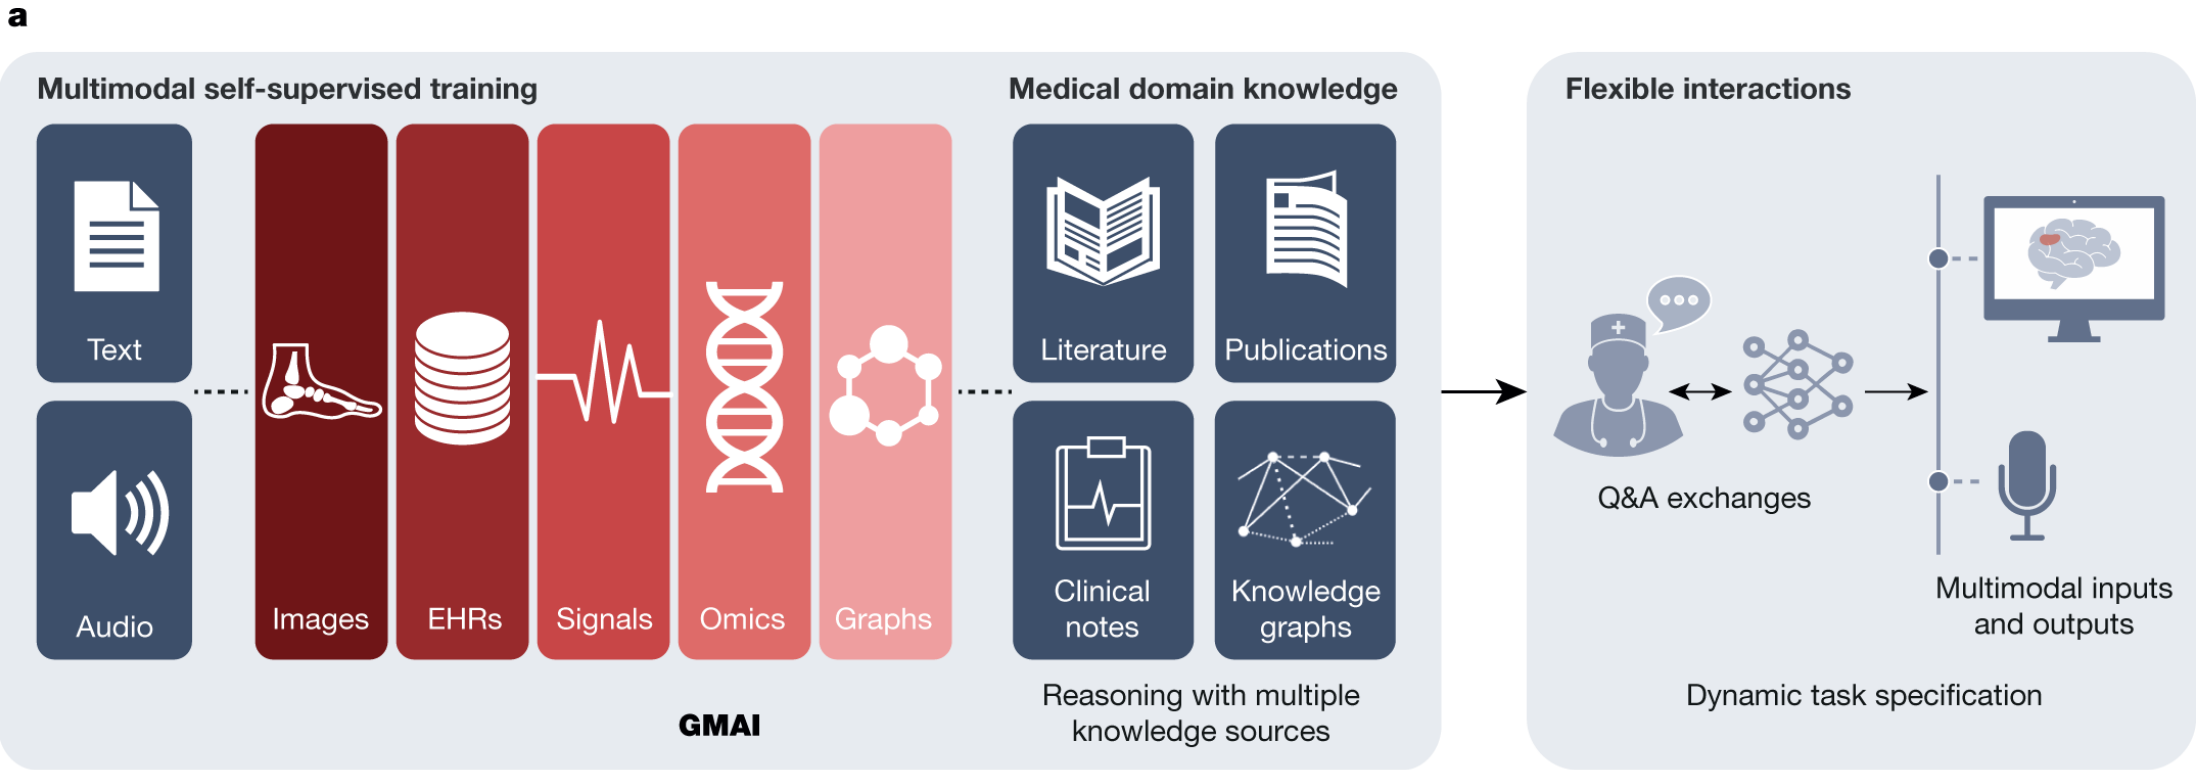

# Temporal and geospatial relations

- Precedence relation and events
  - Temporal logics and time axis
- 4D life cycle of objects
  - New objects
  - New attributes
  - Object  $\leftrightarrow$  Attribute transformation
    - Level of details!
- Consequences:
  - *Static vs dynamic* data structures and **VERSIONING** of object-attribute data
  - 4D context is sufficient for temporal and geospatial relations – see below
- It's a very deep “rabbit hole” ...
  - See Imaguire G. On the Ontology of Relations. *Disputatio*, 4(34), 2012, pp. 689-711

# Natural language, modelling, and grounding

- Descriptions and representations
  - Notational complexity  $\leftrightarrow$  Conceptual complexity
- Physical/Chemical/... ontology and technology domain
- “The Map is Not the Territory”
  - Yudkowsky E. Map and Territory. Machine Intelligence Research Institute, 2018. 231 p.

# Example of “Generalist medical AI”

**Regulations:** Application approval; validation; audits; community-based challenges; analyses of biases, fairness and diversity

# THE CONCEPT OF “MEASUREMENT”

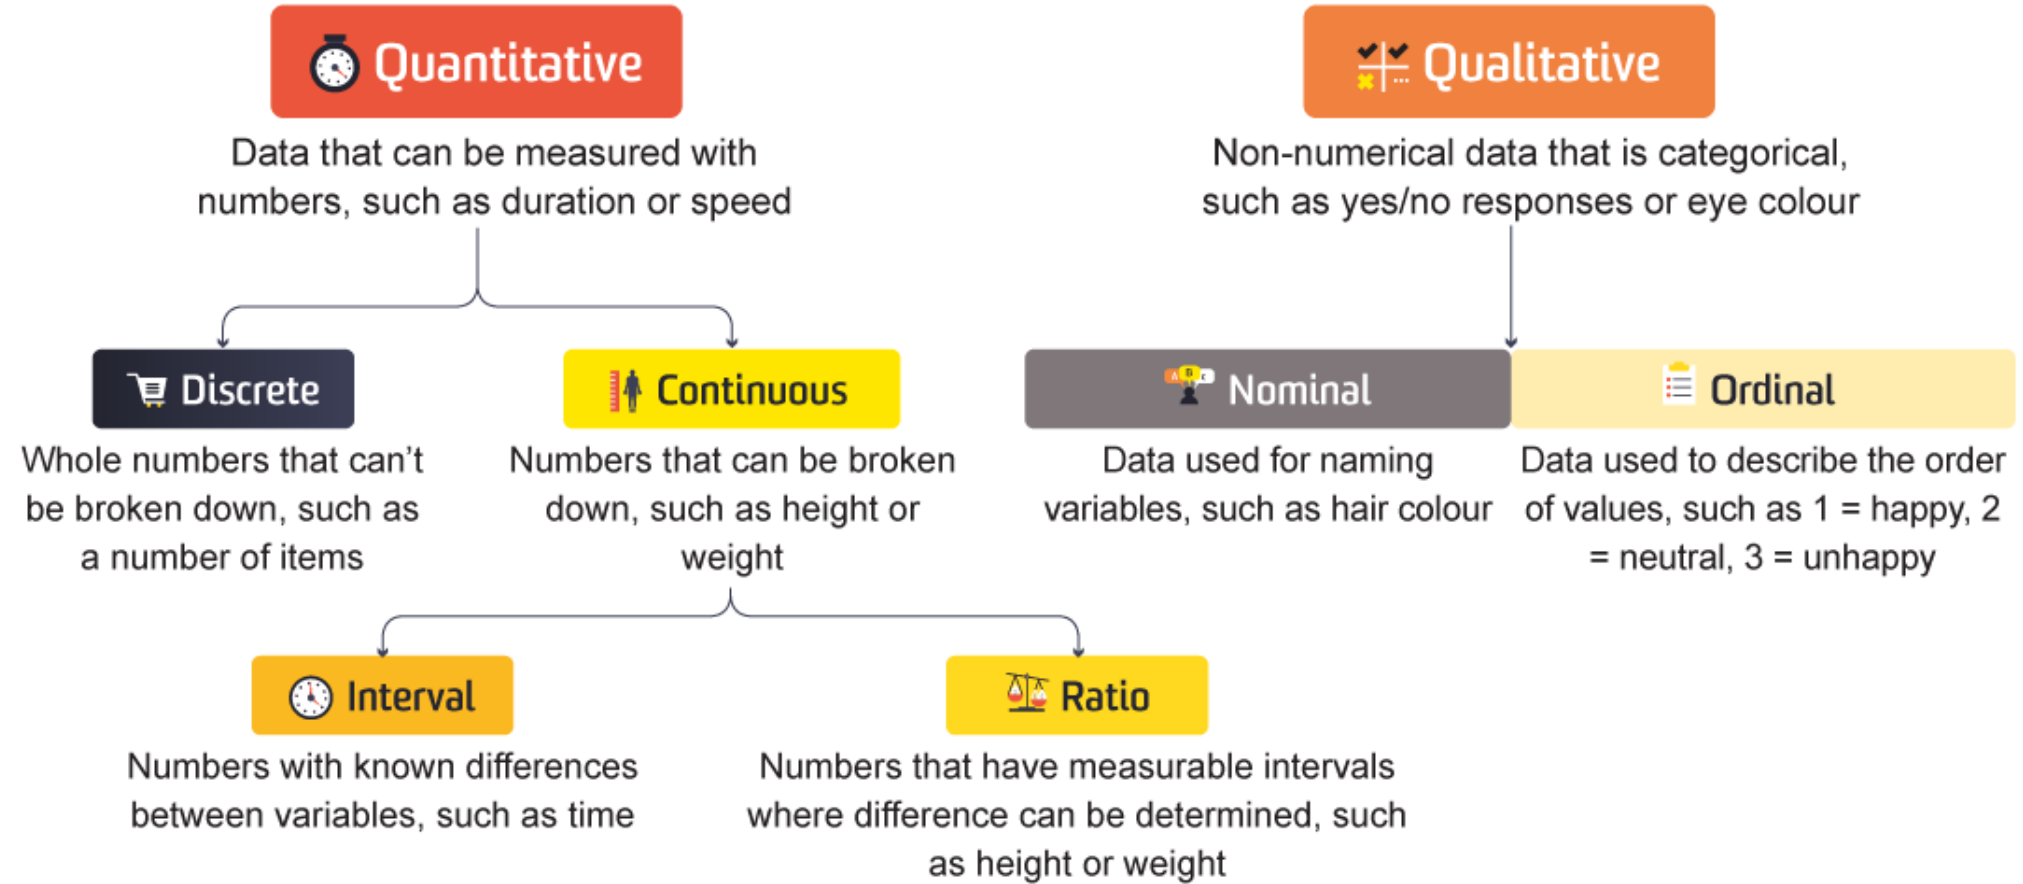

- ✓ Representational measurement theory
- ✓ Context of value in object-attribute data representation
- ✓ Scales
- ✓ ISO standards
- ✓ Ontologies of units of Measure

# Foundations of measurements

- **“Attribute value”** as a result of a measurement!
  - Each measurement has some **context** – a rich description of the circumstances of a measure
    - **Repeated measures design** – a research design that involves multiple measures of the same variable taken on the same or matched subjects either under different conditions or over two or more time periods → **statistics**
      - **Accuracy** is how close a given set of measurements (observations or readings) are to their true value
      - **Precision** is how close the measurements are to each other
- **Measurement theory** is the study of how numbers are assigned to objects and phenomena
- **Representational measurement theory (RMT)**
  - Michell J. Representational measurement theory: Is its number up? / *Theory & Psychology*, 31(1), 2021, pp. 3-23. (<http://journals.sagepub.com/doi/10.1177/0959354320930817>)
  - Benoit E. New scale classification within the representational theory of measurement / *Journal of Physics: Conference Series*, 459, 2013 (<http://iopscience.iop.org/article/10.1088/1742-6596/459/1/012004/pdf>)
  - Heilmann C. A New Interpretation of the Representational Theory of Measurement / *Philosophy of Science*, 82(5), 2015, pp.787-797 (<http://philsci-archive.pitt.edu/11009/1/RTM-Heilmann-PSA.pdf>)

# Data and scales

## Types of Data

# Main kinds of measurement scales

- Types of data & the scales of measurement (<http://studyonline.unsw.edu.au/blog/types-of-data>)
  - Properties of Measurement
    - **Identity**: Identity refers to each value having a unique meaning
    - **Magnitude**: Magnitude means that the values have an ordered relationship to one another, so there is a specific order to the variables
    - **Equal intervals**: Equal intervals mean that data points along the scale are equal, so the difference between data points one and two will be the same as the difference between data points five and six
    - **A minimum value of zero**: A minimum value of zero means the scale has a true zero point
      - Degrees, for example, can fall below zero and still have meaning, but if you weigh nothing, you don't exist
- Four kinds of measurement scales:

Scale	Basis empirical operation	Mathematical group structure	Admissible transformation
<b>Nominal</b>	determination of equality	Permutation group	$y = f(x)$ , $f$ is a bijection
<b>Ordinal</b>	+ determination of greater or less	Isotonic group	$y = f(x)$ , $f$ is a monotonic increasing function
<b>Interval</b>	+ determination of equality of intervals	General linear group	$y = ax + b$ , $a > 0$
<b>Ratio</b>	+ determination of equality of ratio	Similarity group	$y = ax$ , $a > 0$

# Four main kinds of scales

## The Four Scales of Measurement

### Nominal Scale

Used for naming variables in no particular order  
For example, eye colour

### Ordinal Scale

Used for variables in ranked order, but the difference between is not determined  
For example, #1 happy, #2 neutral, #3 unhappy

### Interval Scale

Used for numerical variables with known equal intervals of the same distance  
For example, time

### Ratio Scale

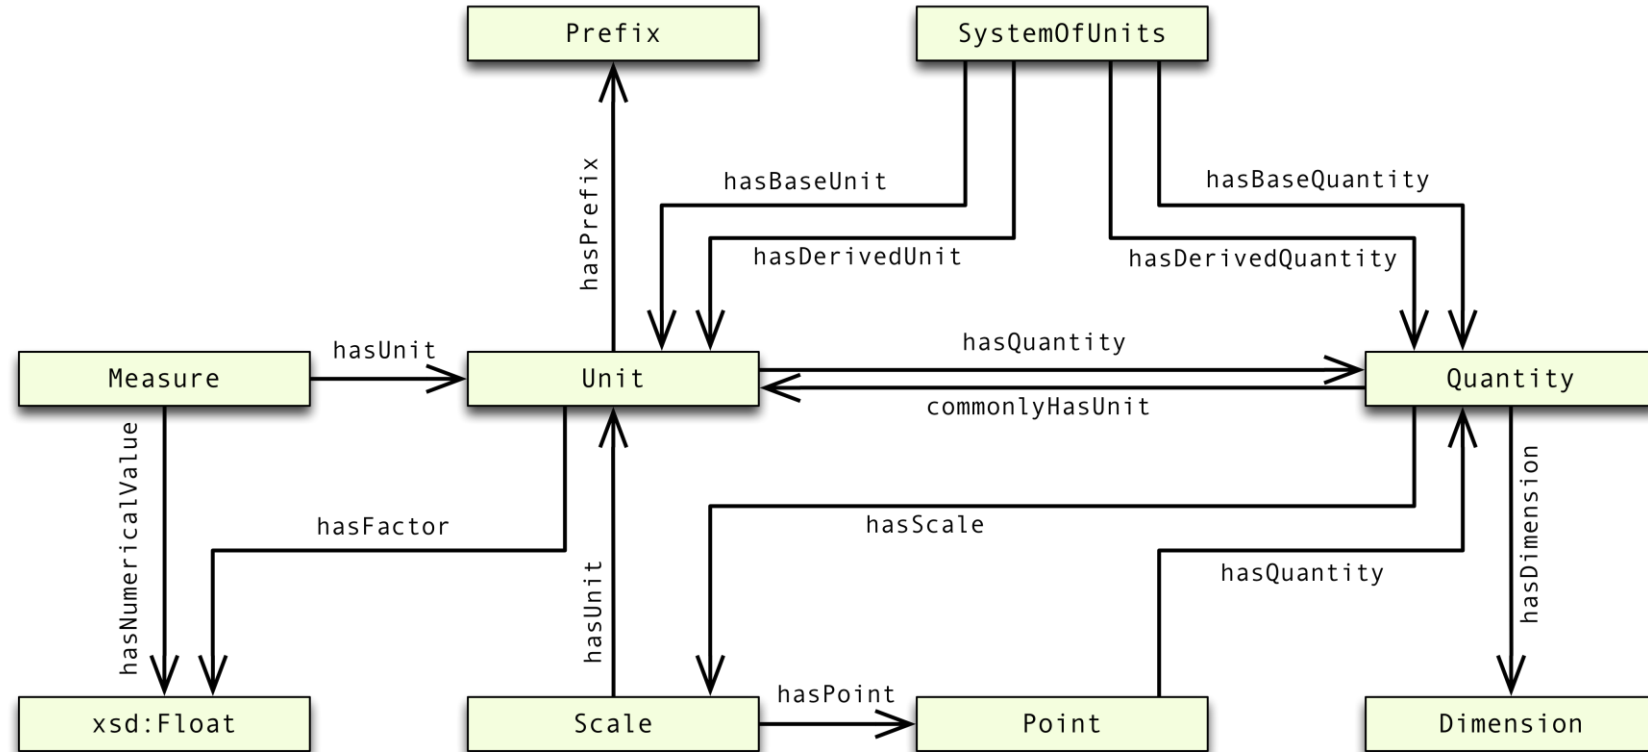

Used for variables on a scale that have measurable intervals  
For example, weight

# Main ISO standard for quantities and units

- ISO **80000-1:2022** Quantities and units — Part 1: **General**  
(<http://www.iso.org/standard/76921.html>)
- ISO 80000-2:2019 Quantities and units — Part 2: **Mathematics**  
(<http://www.iso.org/standard/64973.html>)
- ISO 80000-3:2019 Quantities and units — Part 3: **Space and time**  
(<http://www.iso.org/standard/64974.html>)
- ISO 80000-4:2019 Quantities and units — Part 4: **Mechanics**  
(<http://www.iso.org/standard/64975.html>)
- ...
- ISO 80000-12:2019 Quantities and units — Part 12: **Condensed matter physics**  
(<http://www.iso.org/standard/63480.html>)
- IEC 80000-13:2008 Quantities and units — Part 13: **Information science and technology**  
(<http://www.iso.org/standard/31898.html>)

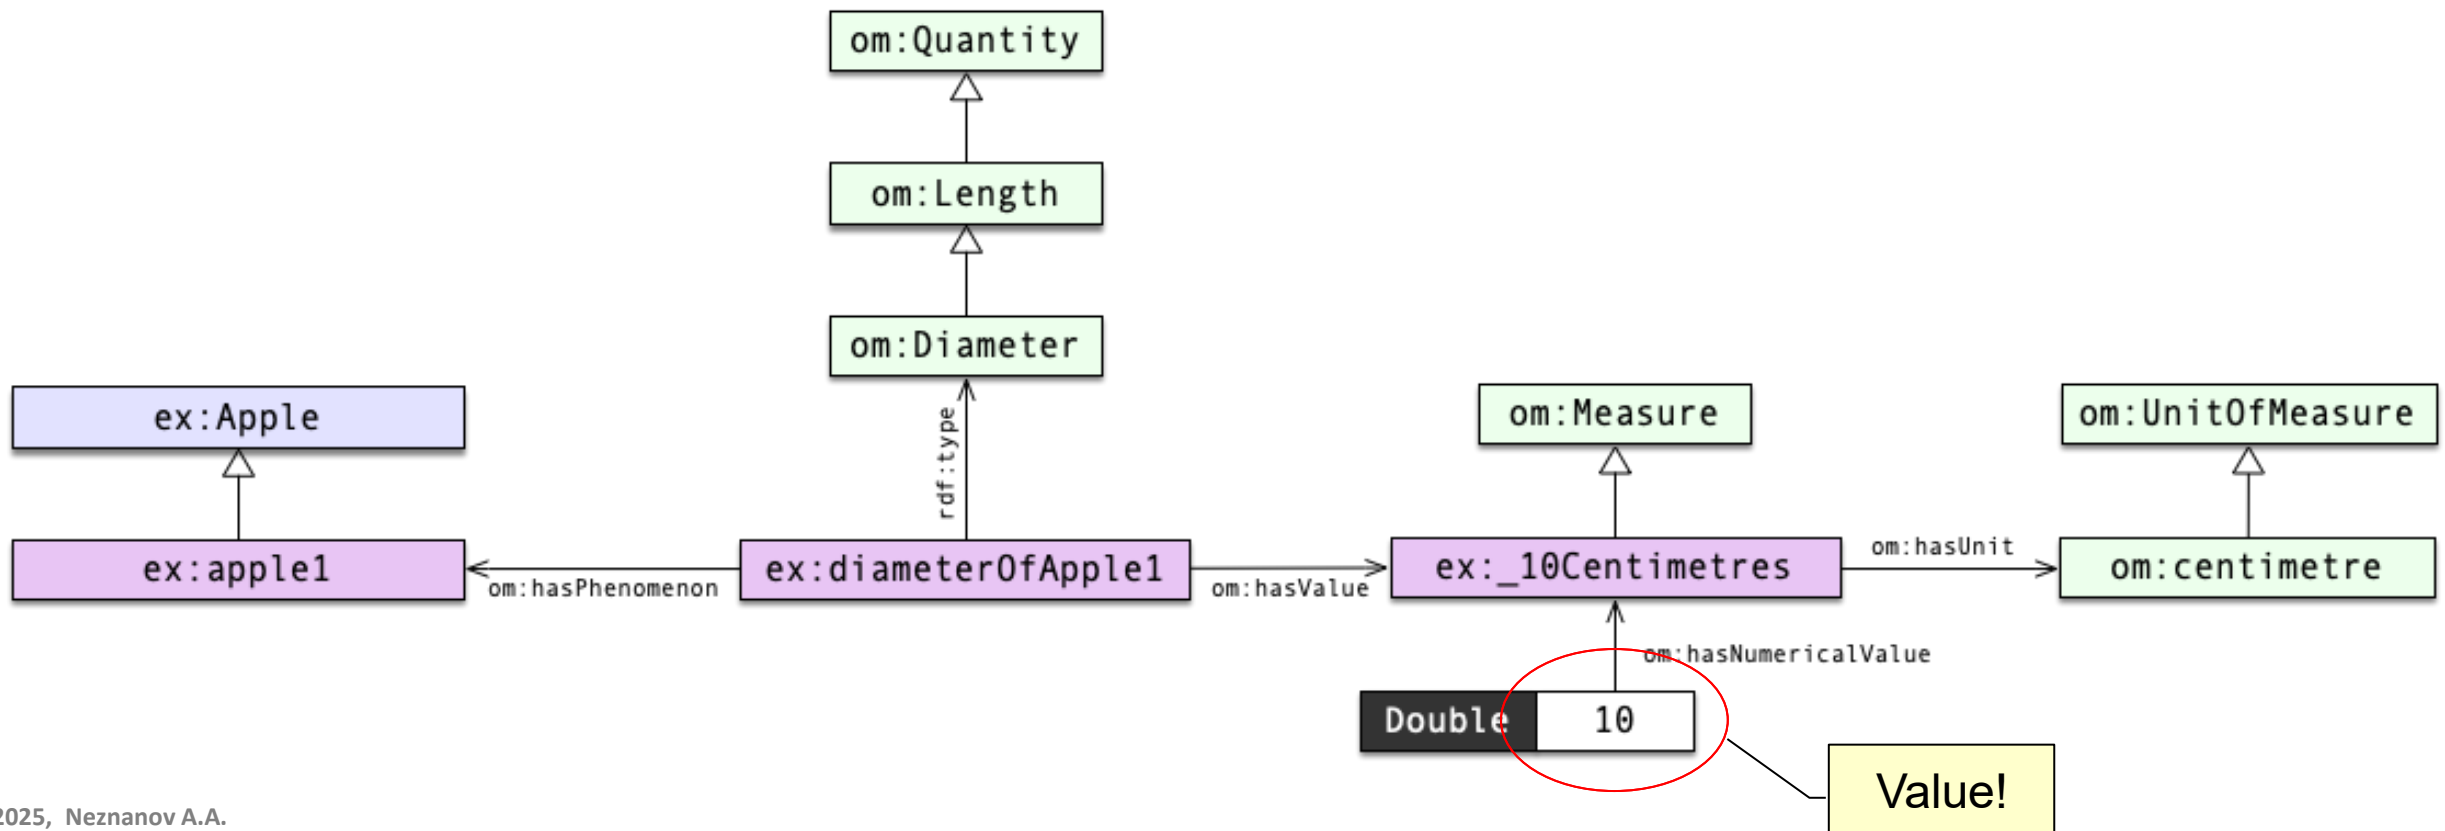

# Ontologies of units of Measure – OM

- [GitHub] HajoRijgersberg/OM (<http://github.com/HajoRijgersberg/OM>)
  - Current version – 2.0.55
  - Classes:814, individuals: 2,246, properties: 34

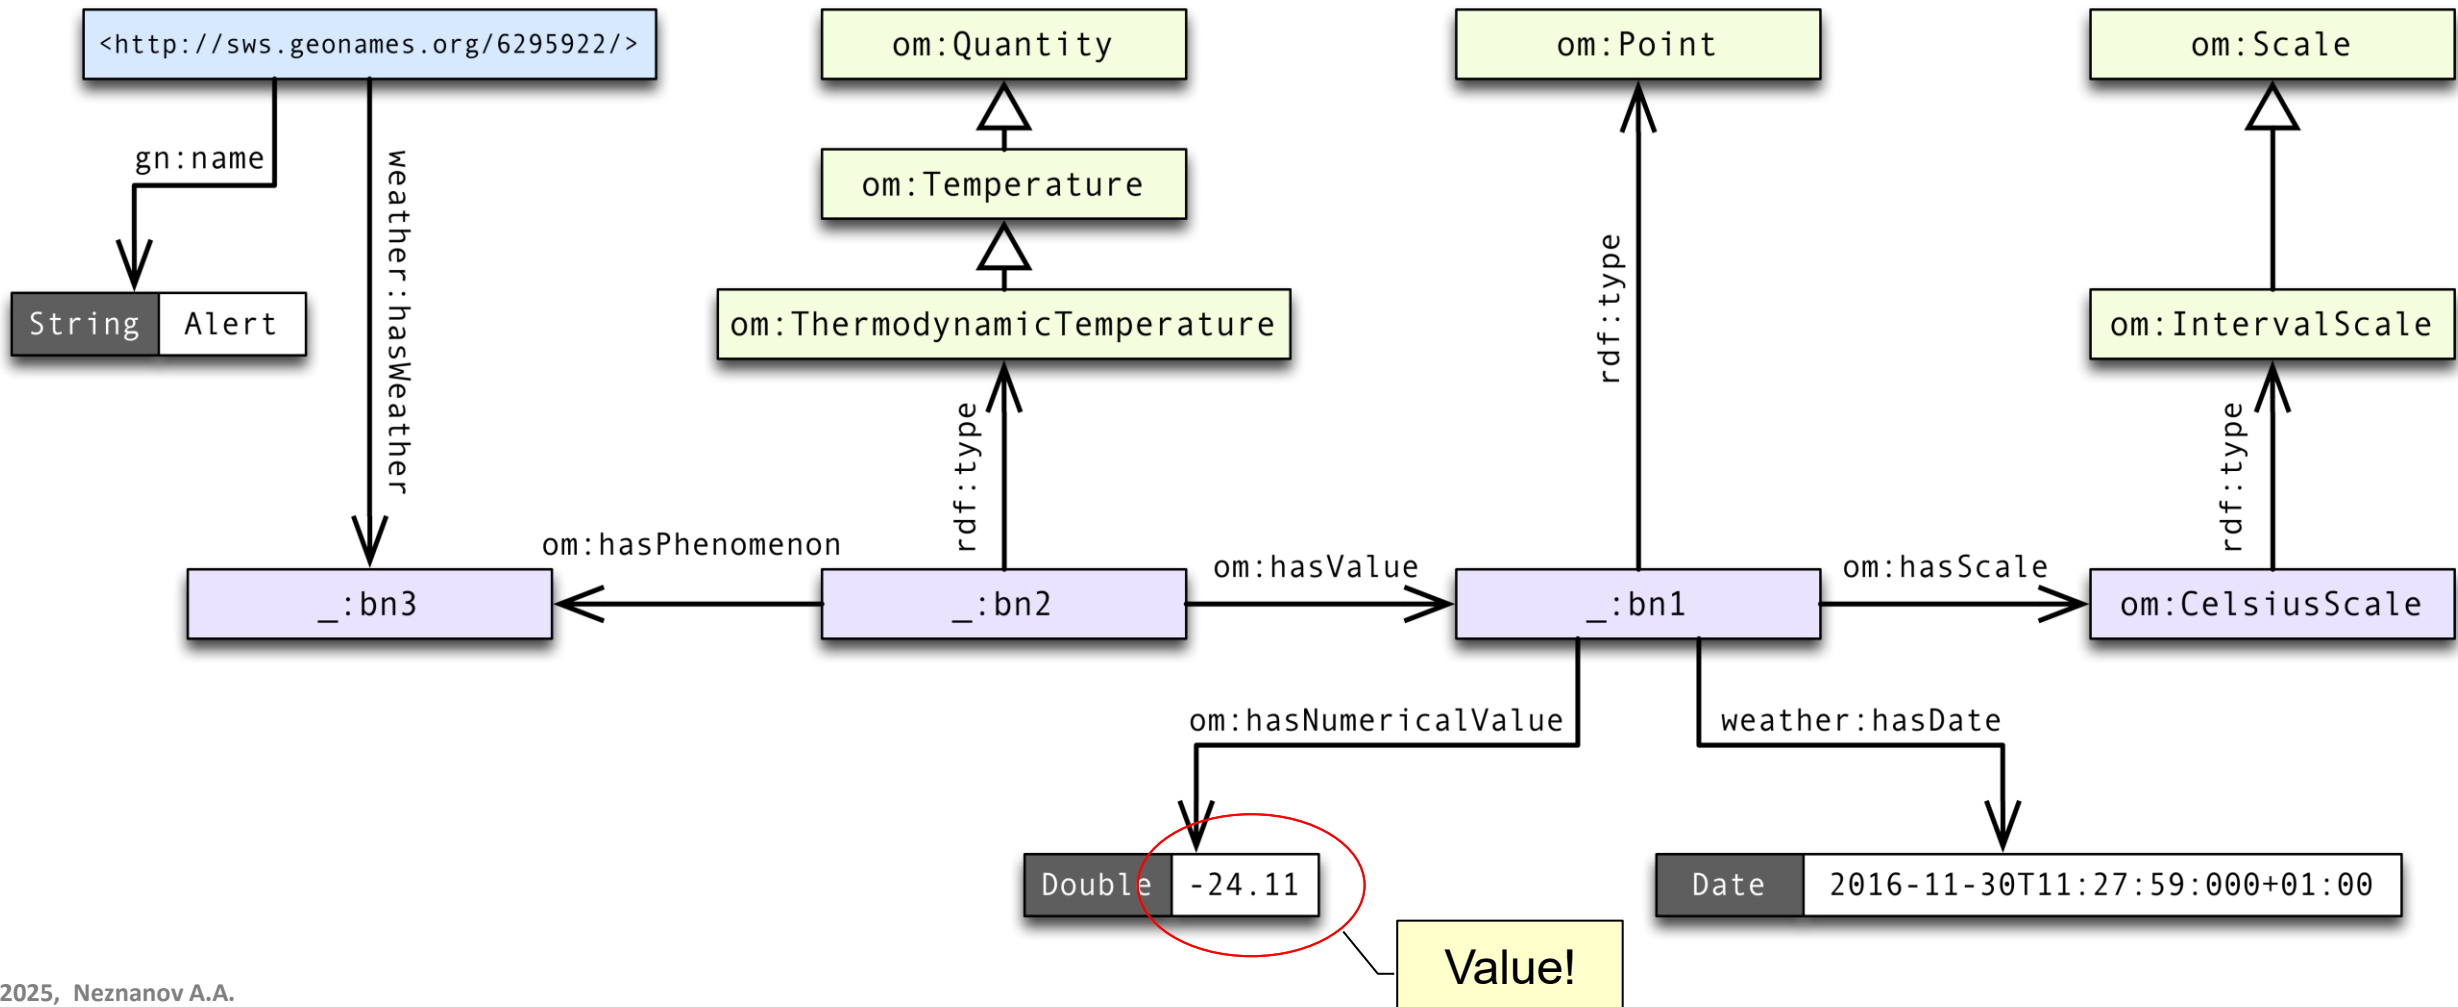

# Example of measurement (OM): the diameter of an apple

- Representation of the “concrete act of measurement” with **references** (and grounding!) to:
  - Ontology of units of Measure («centimeter», «diameter»)
  - Ontology of the subject area («apple»)

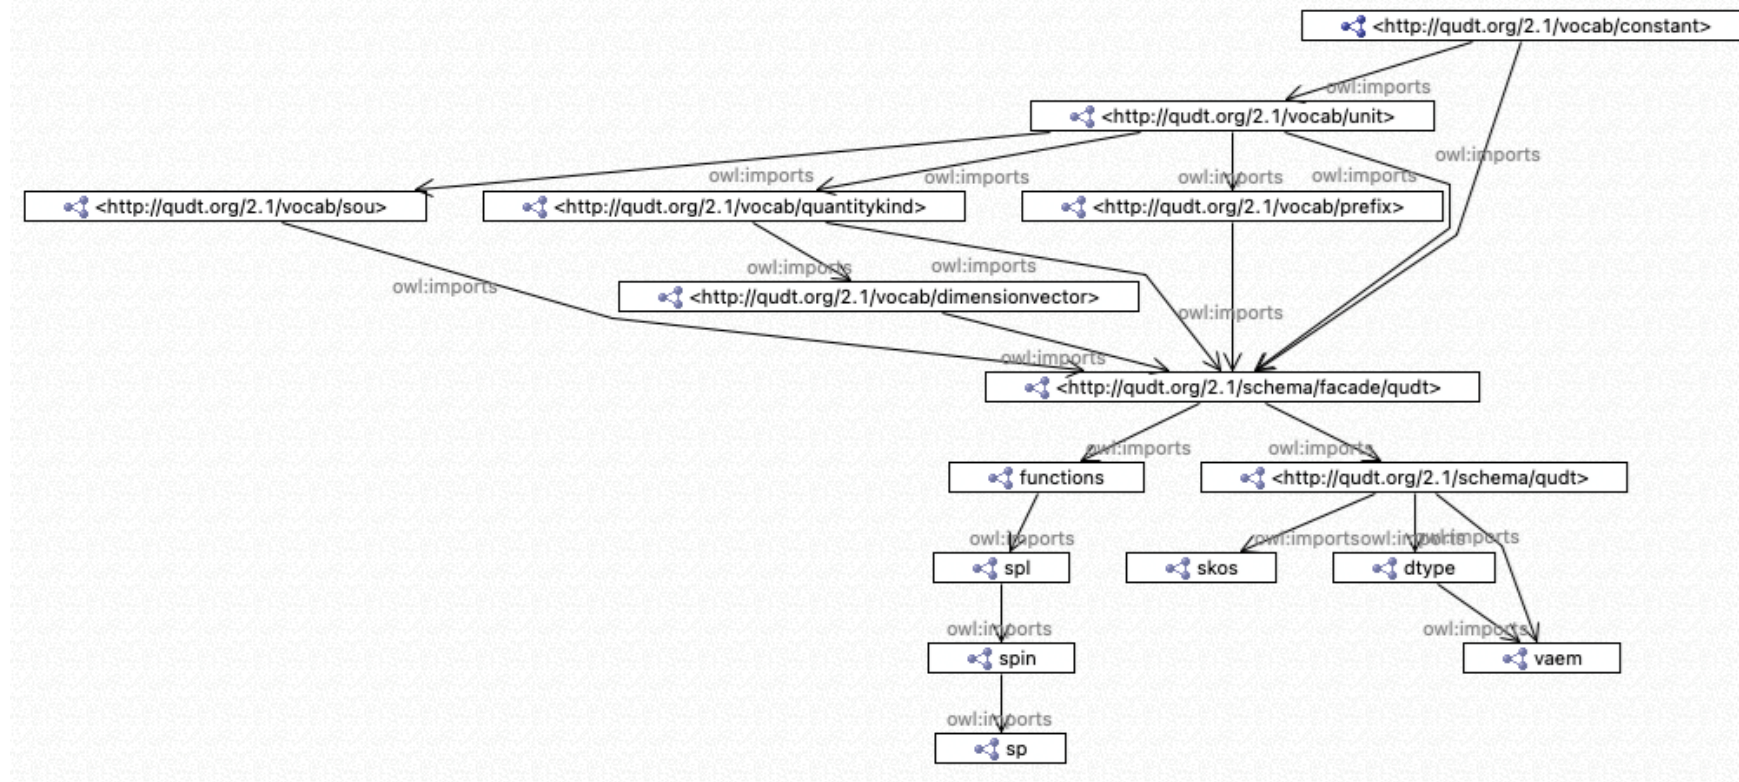

# Example of measurement (OM): temperature

- The temperature at Alert, Canada on November 30th, 2016 at 11:28 AM

# Ontologies of units of Measure – QUDT

- QUDT - **Q**uantities, **U**nits, **D**imensions and **D**ata **T**ypes Ontologies
  - QUDT Units Version 2.1 ([http://www.qudt.org/doc/DOC\\_VOCAB-UNITS.html](http://www.qudt.org/doc/DOC_VOCAB-UNITS.html))
    - Base ontology – classes: 133, individuals: 84, properties: 248
    - + 2509 instances

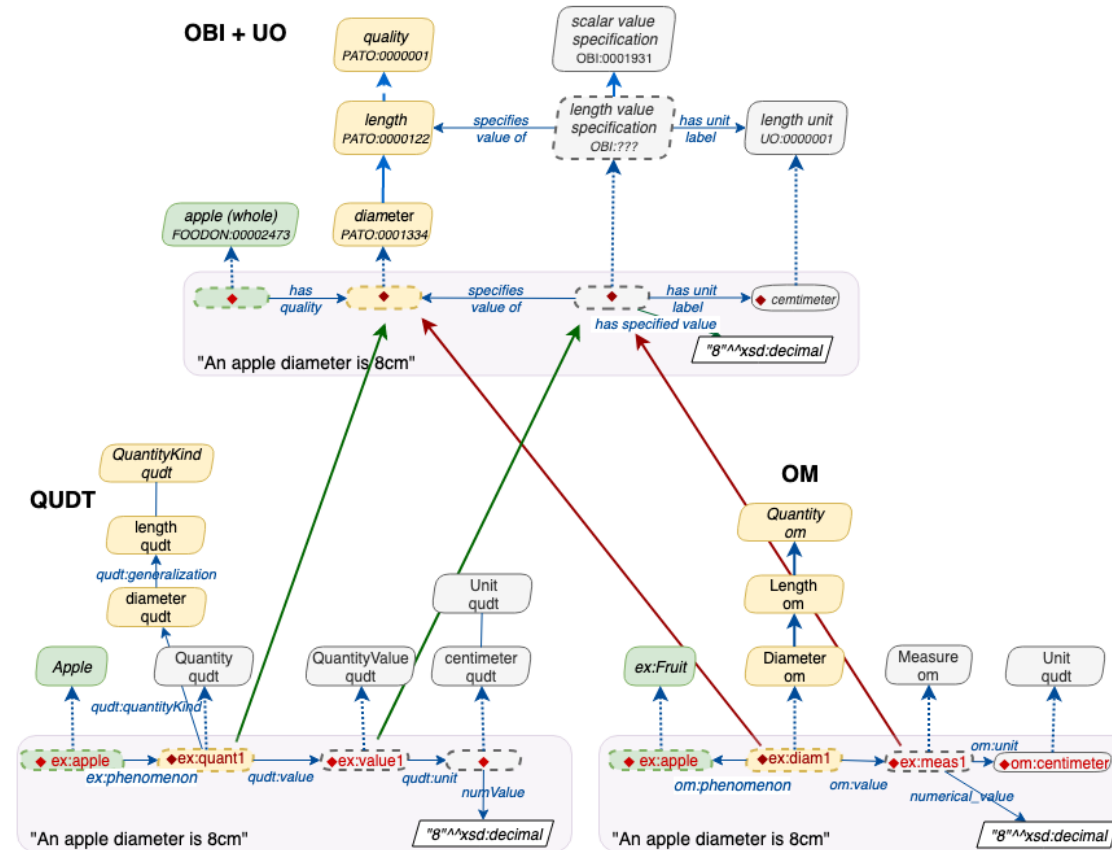

# Ontologies of units of Measure – approaches and comparing

- LinkML – How to model quantities and measurements (<http://linkml.io/linkml/howtos/model-measurements.html>)

## Comparison of OBI + UO / OM / QUDT models

OM & QUDT reference paper: [http://www.semantic-web-journal.net/sites/default/files/swj177\\_7.pdf](http://www.semantic-web-journal.net/sites/default/files/swj177_7.pdf)

(diameter is not currently defined in QUDT)

OM groups the numerical value and unit of a quantity in an instance of class `Measure`. Quantity instances are linked to a measure through property `om:value` (see also Figure 2)

# Ontologies of units of Measure – Specific symbols

- Unit designations from International Virtual Observatory Alliance
  - **Units in the VO** (<http://www.ivoa.net/documents/VOUnits/index.html>)
    - Version 1.1, IVOA Recommendation 2023-12-15
    - Very convenient standard, agreed with BIPM, ISO/IEC, IAU

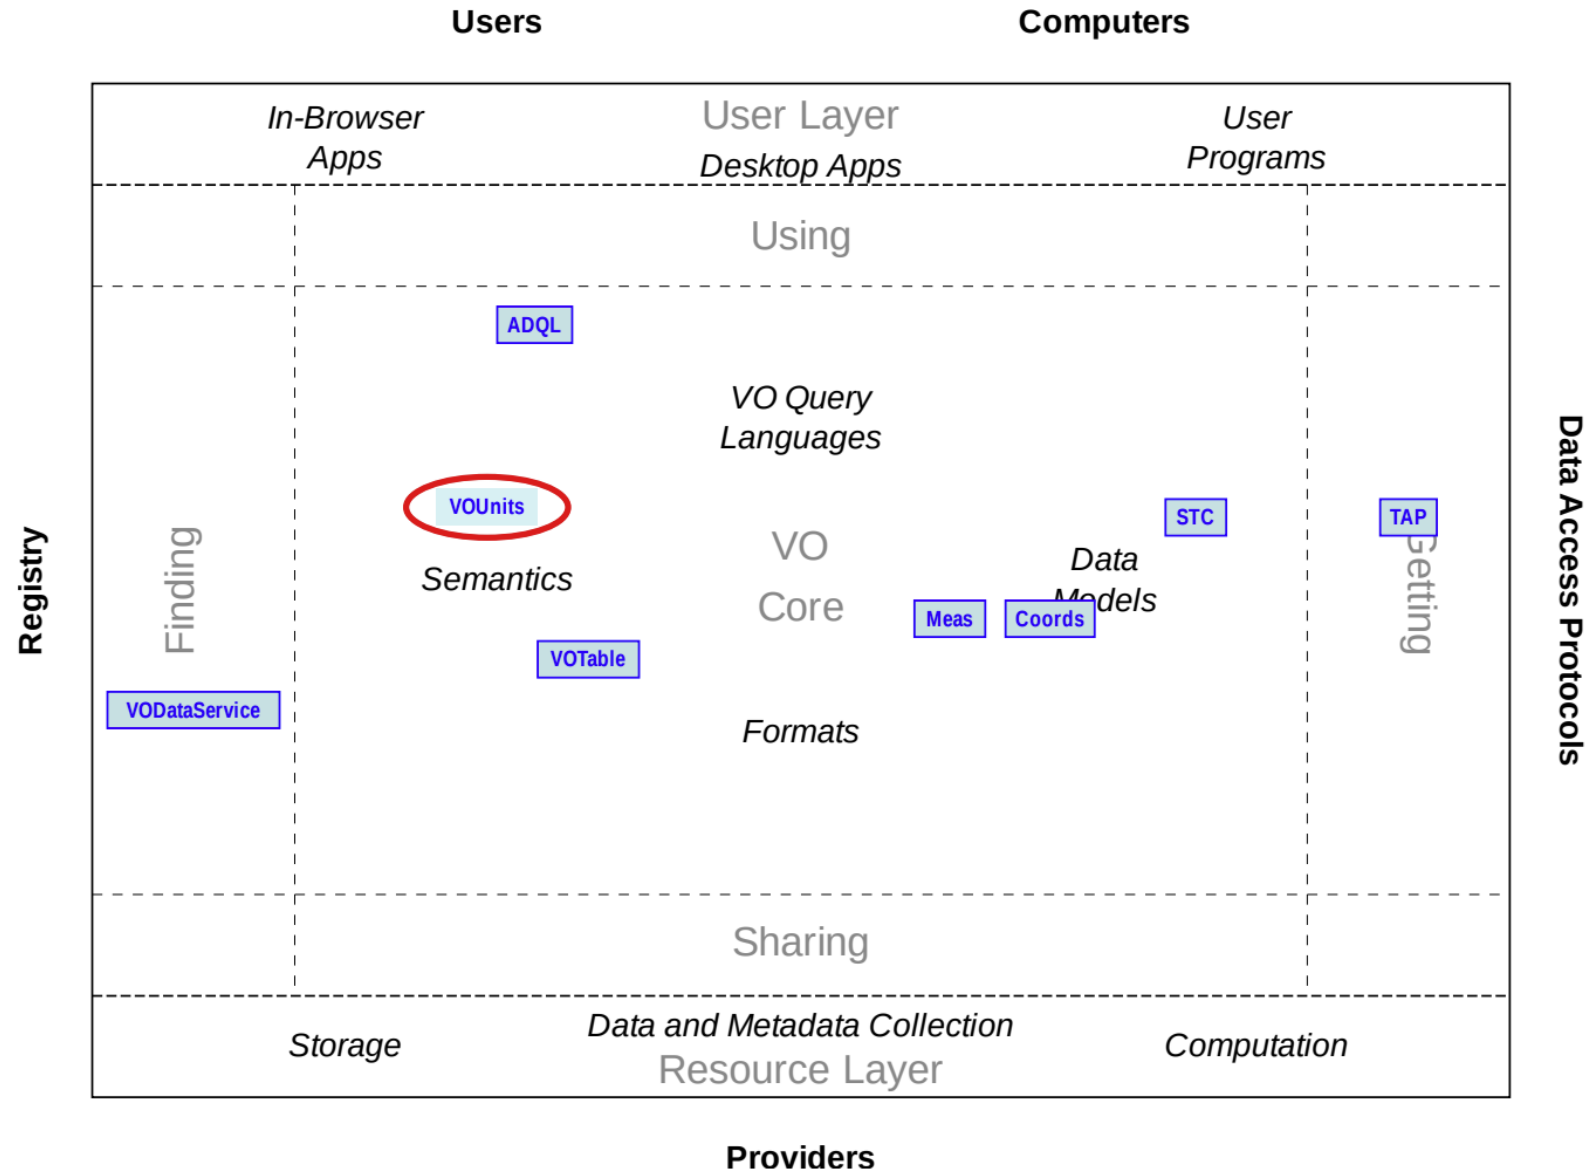

● Example:

<b>m</b> (metre)	<b>g</b> (gram)	<b>J</b> (joule)	<b>Wb</b> (weber)
<b>s</b> (second)	<b>rad</b> (radian)	<b>W</b> (watt)	<b>T</b> (tesla)
<b>A</b> (ampere)	<b>sr</b> (steradian)	<b>C</b> (coulomb)	<b>H</b> (henry)
<b>K</b> (kelvin)	<b>Hz</b> (hertz)	<b>V</b> (volt)	<b>lm</b> (lumen)
<b>mol</b> (mole)	<b>N</b> (newton)	<b>S</b> (siemens)	<b>lx</b> (lux)
<b>cd</b> (candela)	<b>Pa</b> (pascal)	<b>F</b> (farad)	<b>Ohm</b> (ohm)

# VOUnits as a core building block in the VO:

# FORMALIZATION OF CONCEPTS

- ✓ Partially Ordered Sets
- ✓ Formal Concept Analysis
  - ✓ Objects and attributes
  - ✓ Formal context and formal concept
  - ✓ Extension  $\rightarrow$  extent, intension  $\rightarrow$  intent
  - ✓ Formal concept lattice and line diagrams
- ✓ Implications in context and association rules

# Formal Concept Analysis

- Historically, **Formal Concept Analysis (FCA)** is a branch of applied lattice theory that appeared in 1980's
  - Barbut M., Monjardet B. *Ordre et classification: algèbre et combinatoire*. Hachette, 1970.
  - Davey B.A., Priestley H.A. *Introduction to lattices and order*. Cambridge University Press, 1990.
  - **Ganter B., Wille R. *Formal concept analysis*. Springer, 1999.**

# Formal context

- Formal **context** – triple  $\langle G, M, I \rangle$ , where:
  - $G$  – a set of **objects**
  - $M$  – a set of **attributes**
  - $I \subseteq G \times M$  – binary **relation** between  $G$  and  $M$
- The statement  $(g, m) \in I$  (also denoted by  $gIm$ ) is interpreted as “object  $g$  **has attribute**  $m$ ”
  - Remember algebraic definition of “graph”!

- Cross-table representation:

$I$	$y_1$	$y_2$	$y_3$	$y_4$
$x_1$	×	×	×	×
$x_2$	×		×	×
$x_3$		×	×	×
$x_4$		×	×	×
$x_5$	×			

# Formal concept

- With  $A \subseteq G$  and  $B \subseteq M$  in formal context  $\langle G, M, I \rangle$ :
- Operator  $(\cdot)'$  define a **Galois connection** between the powersets  $(2^G, \subseteq)$  and  $(2^M, \subseteq)$ :
  - $A' = \{m \in M \mid \forall g \in A: gIm\}$
  - $B' = \{g \in G \mid \forall m \in B: gIm\}$ 
    - Three properties: (1)  $Z_1 \subseteq Z_2 \Rightarrow Z_1' \supseteq Z_2'$ , (2)  $Z \subseteq Z''$ , (3)  $Z''' = Z'$
- Formal **concept** – pair  $(A, B)$ , such that  $A' = B$  &  $B' = A$  (*duality!*)
  - Set  $A$  is called the “**extent**” (to the *set of instances* of the concept)
  - Set  $B$  is called the “**intent**” (corresponds to the *description* of the concept)
- Concepts are partially ordered by  $(A_1, B_1) \leq (A_2, B_2) \Leftrightarrow A_1 \subseteq A_2$  ( $\Leftrightarrow B_2 \subseteq B_1$ )
- With respect to this partial order, the set of all formal concepts forms a complete lattice called the “**concept lattice**” of  $\langle G, M, I \rangle$

# Implications and rules

- **Attribute implication**  $A \Rightarrow B$  holds if  $A' \subseteq B'$
- **Association rule**  $A \rightarrow B$  is valid if:
  - Its “**support**”  $s = \frac{|(A \cup B)'|}{|G|} = \frac{|(A' \cap B')|}{|G|} \geq \sigma_s$
  - Its “**confidence**”  $c = \frac{|(A \cup B)'|}{|A'|} = \frac{|(A' \cap B')|}{|A'|} \geq \sigma_c$
  - Where  $\sigma_s$  and  $\sigma_c$  are user defined thresholds
- Attribute implication is an association rule with  $c = 1$
- Implications obey Armstrong rules (see below in RM topic)

# Line (Hasse) diagrams (1) – ConExp

- Canonical representation in The Concept Explorer (ConExp) by Serhiy Yevtushenko

The image displays two overlapping windows of the Concept Explorer (ConExp) software. The top window shows a table representing the canonical representation of a concept lattice. The bottom window shows a lattice line diagram with various nodes and edges, along with two selection tables for attributes and objects.

	A	B	C	D	E	F	G	H	A
BirthdayBo		X		X					
IntBirthday									
AddBirthday		X		X					
FindBirthday		X		X					
Remind		X		X					
Success					X				
AlreadyKn		X			X				
NoKnown		X			X				
RAddBirth		X		X					
RFindBirth		X		X					
RRemind		X		X					
Obj 12									

The lattice line diagram in the bottom window shows nodes for attributes (NAME, DATE, REPORT, Success, Alreadyknown, NoKnown) and objects (BirthdayBook, AddBirthday, FindBirthday, Remind, RAddBirthday, RFindBirthday, RRemind). The diagram is a Hasse diagram where nodes are connected by lines representing subconcept-superconcept relations.

Name	Is selected
NAME	<input checked="" type="checkbox"/>
DATE	<input checked="" type="checkbox"/>
REPORT	<input checked="" type="checkbox"/>
Atr 4	<input type="checkbox"/>
Atr 5	<input type="checkbox"/>
Atr 6	<input type="checkbox"/>
...	
Select all attributes	

Name	Is selected
FindBirthday	<input checked="" type="checkbox"/>
Remind	<input checked="" type="checkbox"/>
Success	<input checked="" type="checkbox"/>
AlreadyKnown	<input checked="" type="checkbox"/>
NoKnown	<input checked="" type="checkbox"/>
RAddBirthday	<input checked="" type="checkbox"/>
RFindBirthday	<input checked="" type="checkbox"/>
RRemind	<input checked="" type="checkbox"/>
Select all objects

# Binary attributes and scaling

- Example from Davey and Priestley (1990)
  - Planets and their properties
- Scaling of attributes:
  - Size: diameter,  $m \Rightarrow$  (“small”, “medium”, “large”)
  - Distance to Sun: distance,  $m \Rightarrow$  (“near”, “far”)
  - Moon(s): predicate, Boolean  $\Rightarrow$  (“yes”, “no”)

Planets	Size			Distance to Sun		Moon(s)	
	small	medium	large	near	far	yes	no
Jupiter			x		x	x	
Mars	x			x		x	
Mercury	x			x			x
Neptune		x			x	x	
Pluto	x				x	x	
Saturn			x		x	x	
Earth	x			x		x	
Uranus		x			x	x	
Venus	x			x			x

# Scaling, ontologies, and context tracking

# ENTITIES AND DATA MODELS

- ✓ Formal Concept Analysis
  - ✓ Objects and attributes
  - ✓ Formal context and formal concept
  - ✓ Extension  $\rightarrow$  extent, intension  $\rightarrow$  intent
  - ✓ Formal concept lattice and line diagrams
- ✓ Implications in context and association rules

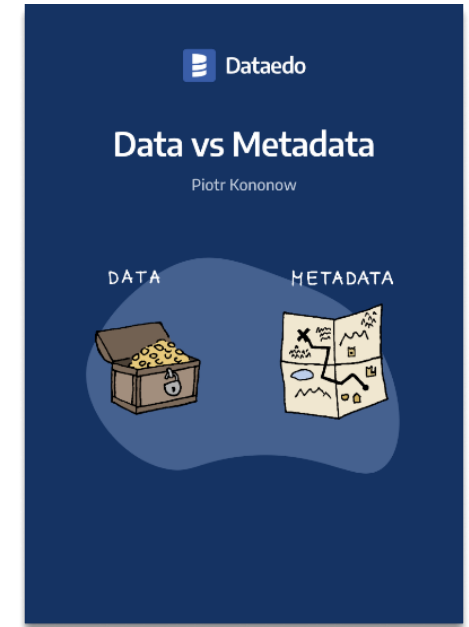

# Main tasks of data processing

- Information system (IS) as a data processing facility
  - Relevant knowledge about data → adequate data processing
  - Workflows and pipelines (another big lecture)
- Six main tasks:
  1. **Input/Output**
  2. **Format conversion (sic!)**
  3. **Telecommunication**
  4. **Storage**
  5. **Search (data retrieval)**
  6. **Manipulation**
    - Analysis!

# Data and metadata

- *The knowledge* appears at the **metadata** level
  - Data about data 😊
  - What is Metadata (with examples)  
(<http://dataedo.com/kb/data-glossary/what-is-metadata>)
  - Dataedo – Data vs Metadata (<https://landing.dataedo.com/data-vs-metadata>)
- Metadata management
  - Full chapter in DMBok (Chapter 12: Metadata Management)!
- Metadata formalization and standardization
- Metadata about metadata (infinite hierarchy)
  - Where can we stop? **Metadata**, **metametadata**, **metametametadata**, ...
  - The problem of harmonization of *ontologies* and *ontics* (interpretation)
  - The problem of interoperability
- Metadata and meta-modelling: modelling, notations, architecture
  - Model, **meta**model, **metameta**model, ... (see UML meta-model, BPMN metamodel)

# Object-oriented analysis and design

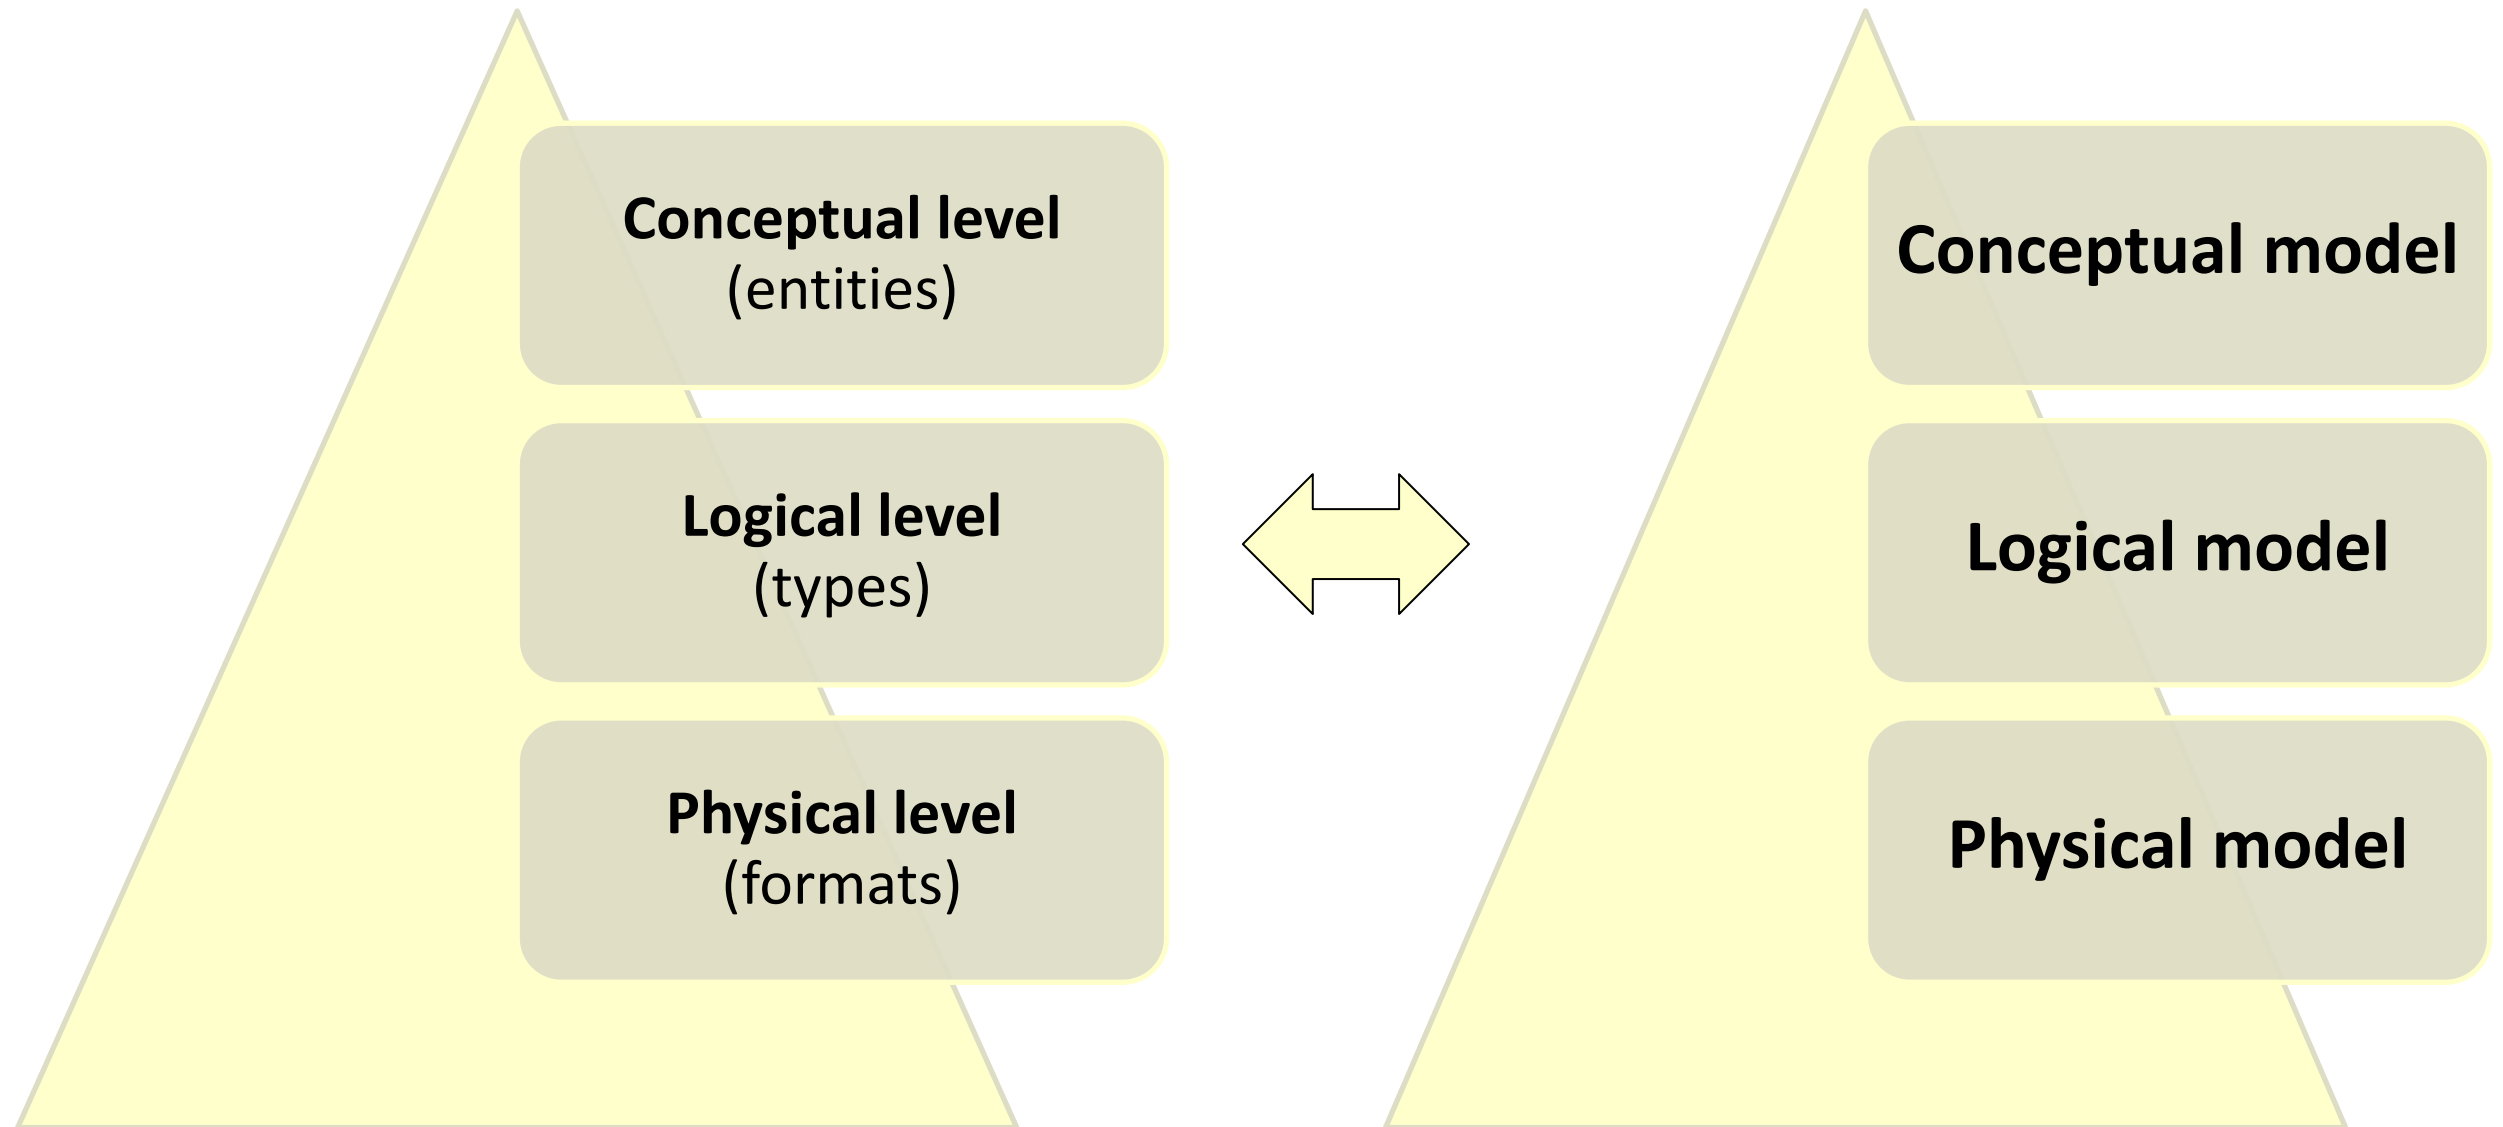

- **Object** – an arbitrary entity for which the boundaries, state and behavior are easy to define
- **Attribute** – an object property
  - The set of attribute values defines the object state
- **Method** – a variant of object behavior
  - The set of methods defines the object behavior
- **Interface of object** – the external representation of the object, i.e., all its attributes and methods
  - The interface description defines the object boundaries by the very fact of attributes and methods inclusion or non-inclusion in the interface
- **Class** – a description of objects of the same type, i.e. their common interface
  - A class can be represented as a **template** that describes the possible objects' states and behavior
  - The object that satisfies this pattern is called an **instance of a class**
  - All instances of a class have the same interface
  - The class declaration formalizes the boundaries, state and behavior discussed in the object definition above
  - In OO programming languages a class is a **data type**

# Basic types of relationships in OO-analysis

- Relationships between objects and classes
  - **Instantiation** (“instance-of”) – relationship between a class instance and a class
- Relationships between classes
  - **Generalization** (“is-a”) – relationship between a successor and an ancestor (oriented from a successor to an ancestor)
    - In the opposite direction – **specialization** (from an ancestor to a successor)
    - **Inheritance** – a mechanism for implementing a generalization/specialization relationship
  - **Realization/implementation** – relationship between a class and an interface/abstract class
- Relationships between objects (usage)
  - **Association** – arbitrary “using” relationship between two or more objects in which the objects have their own lifetime and there is no “owner”
    - Binary associations can be unidirectional and bidirectional (symmetrical)
  - **Aggregation** (“part-of”) – relationship between a part and a whole (weak containment)
  - **Composition** – aggregation, when a part is **integral** (one “part” cannot belong to more than one “whole” and the lifetime of the “part” coincides with the lifetime of the “whole”) (strong containment)

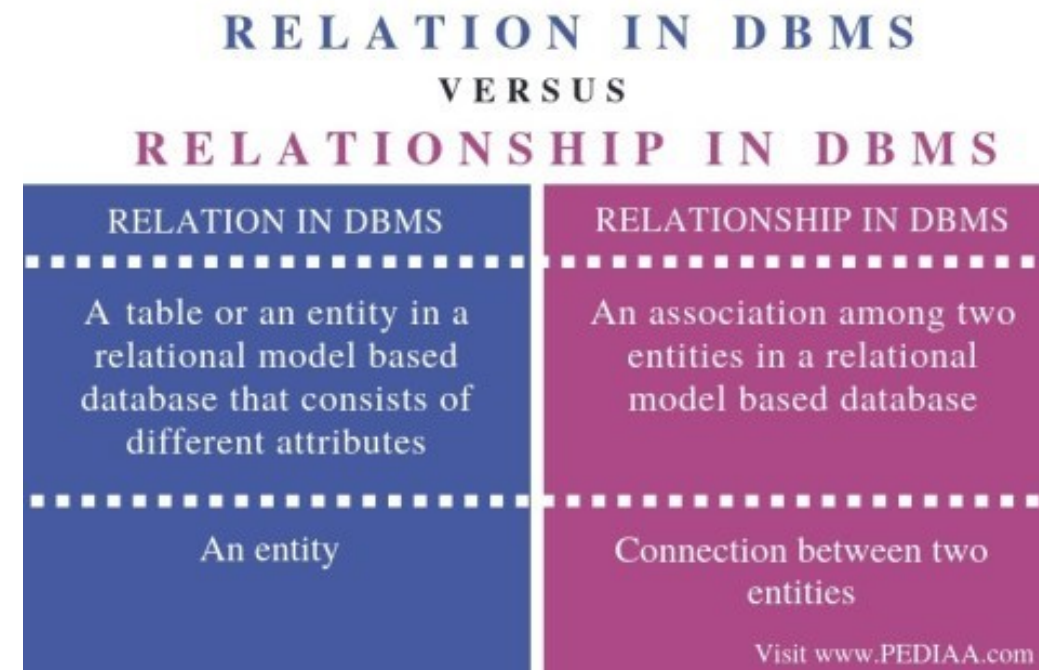

# Three levels of data models abstraction

# The note about relation(ship)

- Complex word usage!
  - Historically and traditionally:
    - Britannica: “Relations” and “Relationship” (<http://www.britannica.com/dictionary/eb/qa/relations-and-relationship>)
    - BBC: Relative / relation – relationship (<http://www.bbc.co.uk/worldservice/learningenglish/grammar/learnit/learnitv235.shtml>)
    - Discussion (<http://english.stackexchange.com/questions/15208/relation-versus-relationship>)
- The main difference is that relationship is broader than relation
  - Both can mean “the way in which two or more concepts, objects, or people are connected”
  - In addition, relationship can mean “the state of being connected”
- Later we discuss additional senses!
  - “Relation” in relational algebra

# Entity-relationship model

- Peter Pin-Shan Chen, 1976
- **Entity-Relationship Diagrams** – visual language for conceptual data modelling
  - Standard abbreviations – **ER** and **ERD**
  - Both terms “entity” and “relationship” are incomprehensible and need clarification
    - Wikipedia is a very bad source here!
  - ER is a **static model**
    - We will discuss further both time consideration and special notations (UML, BPMN, etc.)
- A huge number of extensions and variations:
  - Semantics extensions
  - Various “syntax sugar” for working with large diagrams
  - A plenty of visual images variations
  - Confusion with **IDEF1X**
    - See ISO 31320-2:2012 Information technology — Modeling Languages — Part 2: Syntax and Semantics for IDEF1X97 (IDEFobject) (<http://www.iso.org/standard/60614.html>)

# ER origins and advancing

- Almost **fifty years** of development

- Chen P. The Entity-Relationship Model-Toward a Unified View of Data. ACM Transactions on Database Systems, 1, 1976. pp. 9-36 (<http://www.csc.lsu.edu/~chen/pdf/erd-5-pages.pdf>, <https://pdfs.semanticscholar.org/1348/1add6a6ce710af7004577ccb0ea7f92e887d.pdf>)

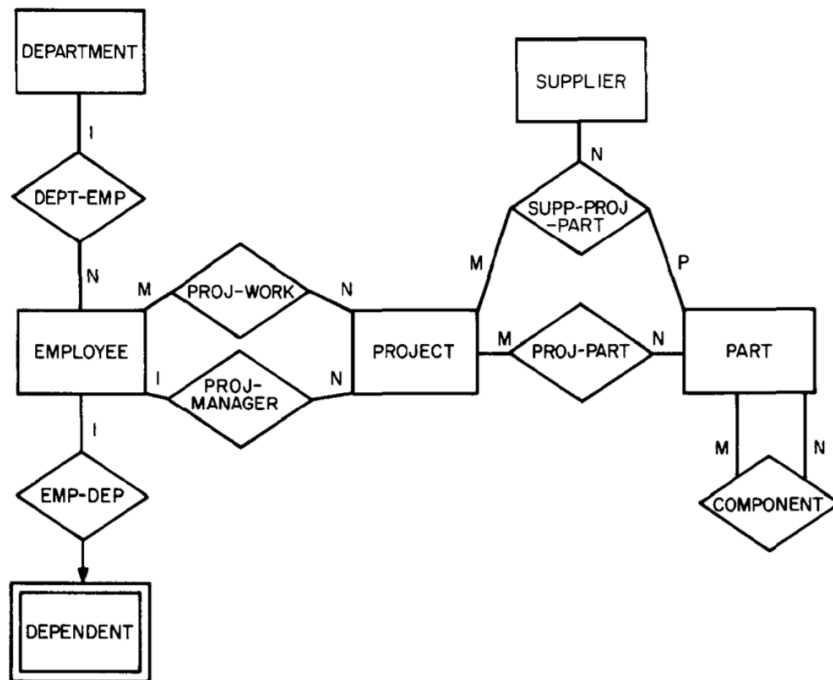

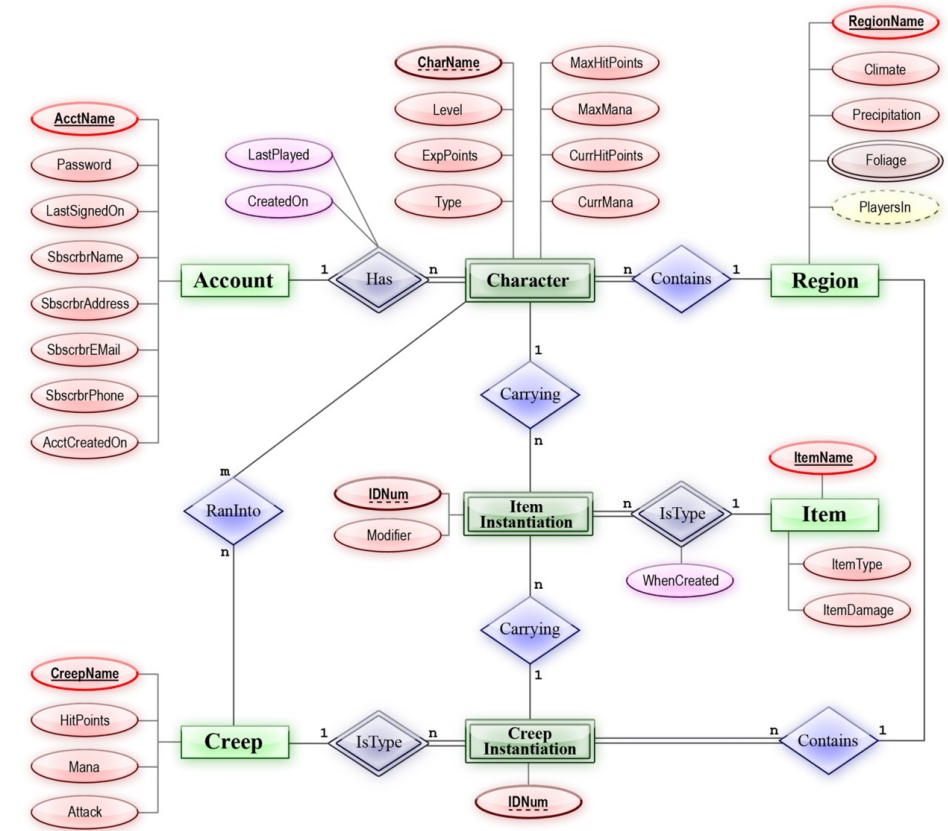

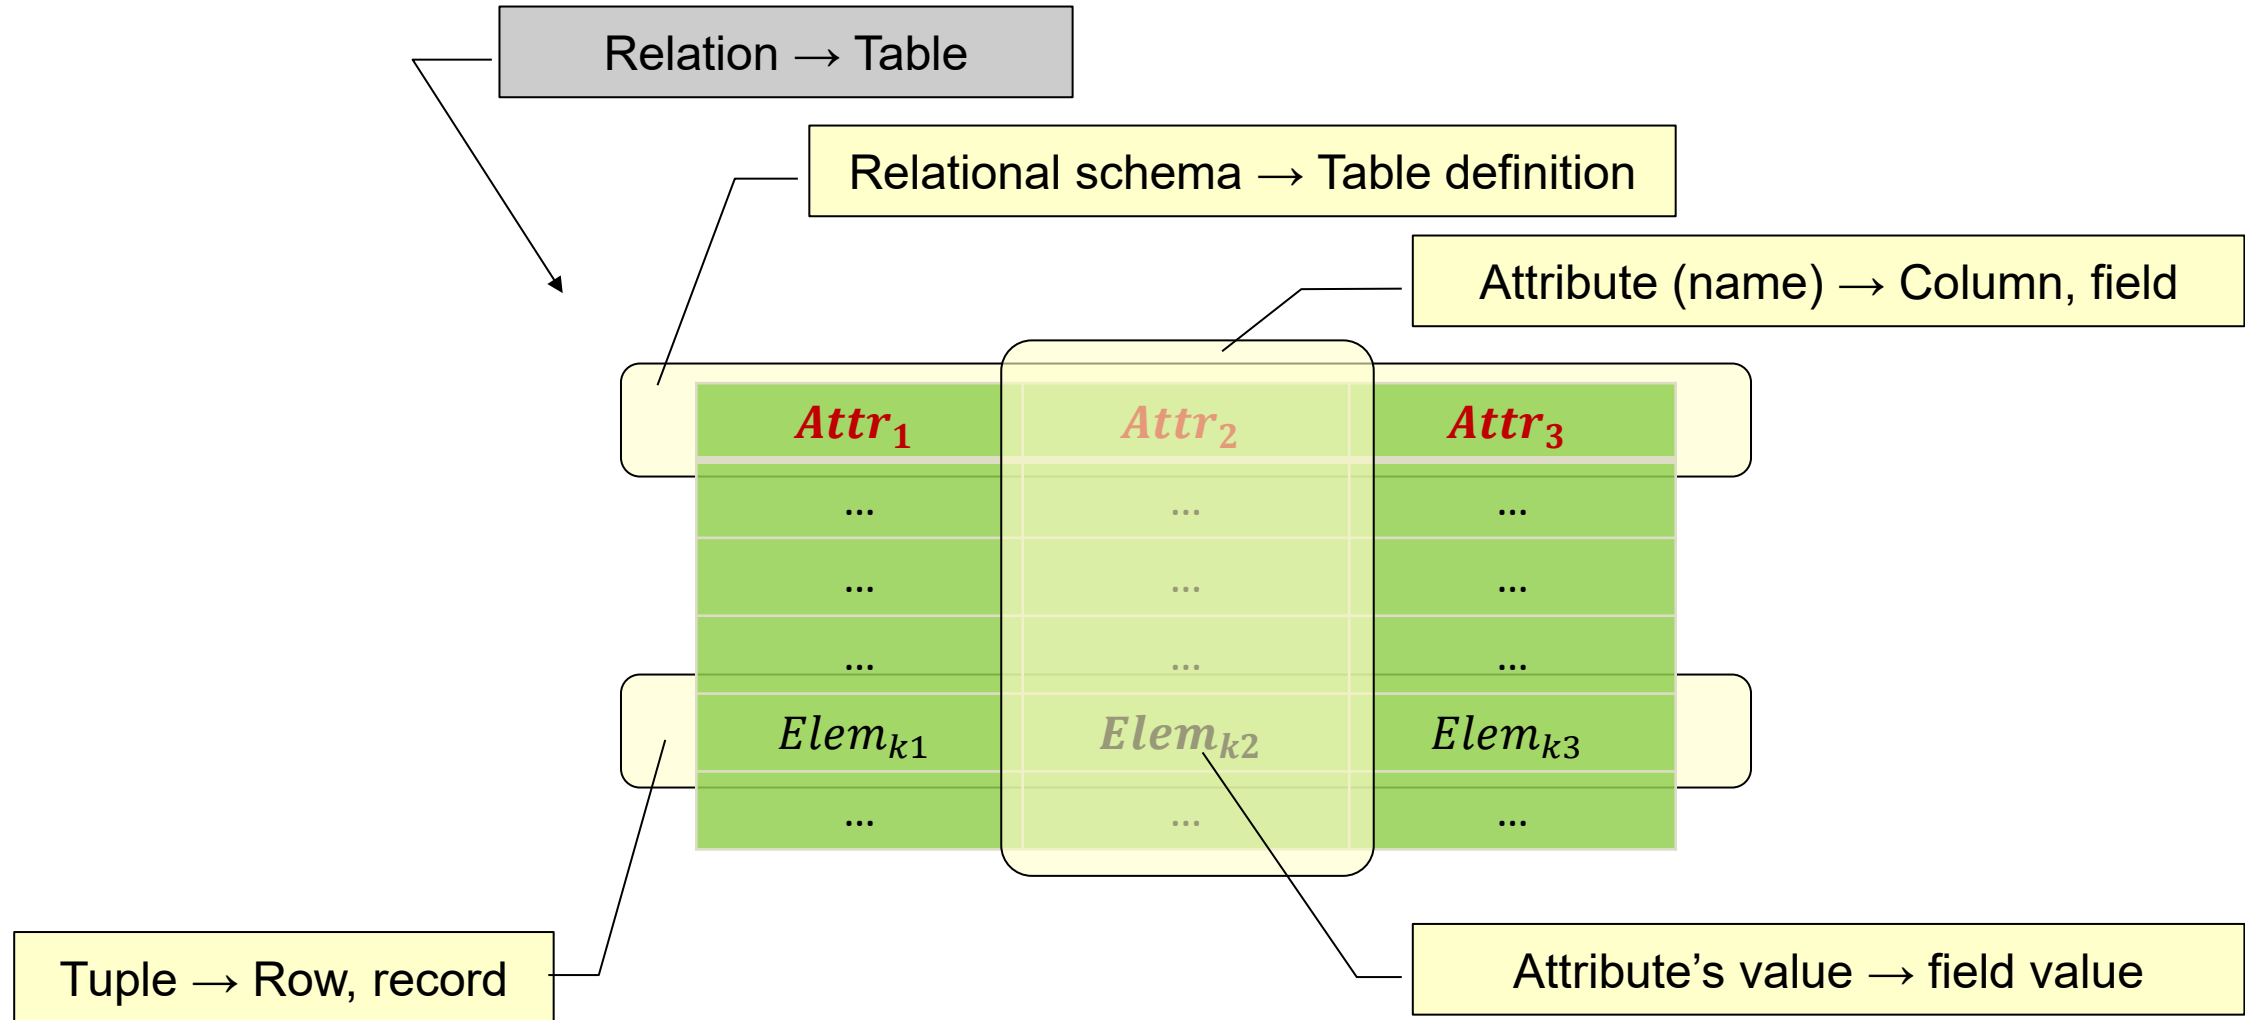

Fig. 11. An entity-relationship diagram for analysis of information in a manufacturing firm  
ACM Transactions on Database Systems, Vol. 1, No. 1, March 1976.

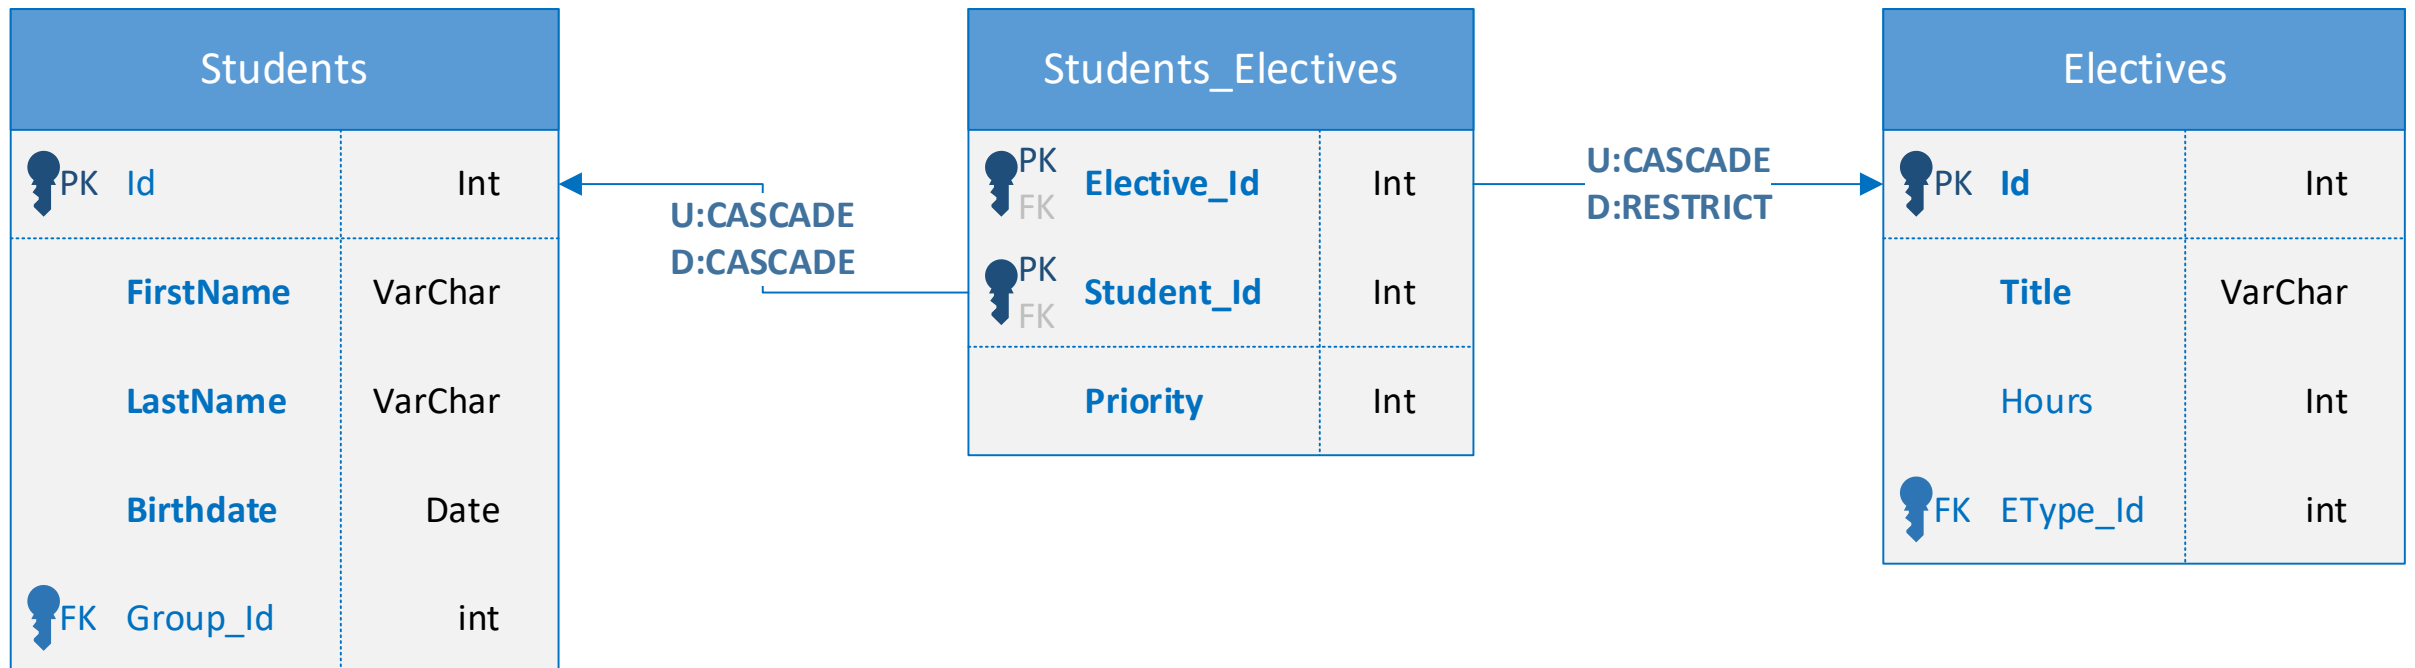

# Relation $\rightarrow$ Table

# RS/TR origins and advancing

- Relational schemas or table-reference diagrams
  - Codd, E. A Relational Model of Data for Large Shared Data Banks. Communications of the ACM, 13(6), 1970, pp. 377-387. (<http://www.seas.upenn.edu/~zives/03f/cis550/codd.pdf>)
  - Codd E.F. The relational model for database management: version 2. Addison-Wesley, 1990. 538 p.

# Conceptual and logical levels of classical ER/TR approach

	<b>ER Model</b>	<b>Relational Model</b>
Level	Conceptual	Logical (representation or implementation)
Purpose	Shows real-world entities, their characteristics, and the relationships between them.	Shows data about objects in tables, and how the tables relate to each other.
Used by	For anyone who needs to see how the data model will be formed.	Mostly for data engineers and programmers who need to see where data will be stored.
Language and notations	Chen, Martin, UML, and other notations.	Relational/Schema diagrams, SQL.
Main components	Entities, attributes, relationships, arrows	Tables (relations), columns, domains, keys, records
Relationships	Relationships can be easily seen and identified through the use of arrows and symbols.	It is more difficult to determine the relationships between tables.
Mapping	Has the possibility to show cardinality mapping in explicit way.	Not possible to see cardinality mapping (only "foreign keys" with constraints).

# SQL table and their rows VS query and their recordset

- A relation's **tuple** <> a **row** from a query result (output rows of a SQL SELECT statement)
  - Remember PKs and "DISTINCT" keyword!
- A **recordset** (or **result set**) is a data structure that consists of a group of records as the result of a query to a data source
  - Recordset is not a set (in set-theoretic sense)!
  - Recordset has local schema!
  - Recordset has ordering!
  - Recordset can have duplicates!

# Dependency mining and relational constraints

- Dependency
  - Functional dependency (FD)
  - Approximate functional dependency (AFD)
  - Multi-valued dependency (MVD)
  - ...
- Apparatus of dependencies was introduced by William W. Armstrong (Armstrong's Axioms)
  - Beeri, Fagin и Howard created apparatus of multi-valued dependencies
  - Hugh Darwen formulated [General Unification Theorem](#)
- Keys (PKs, FKs)!
- Normalization/**denormalization!**
  - How to build object-attribute dataset from relational model? See further!
- Data mining! ...

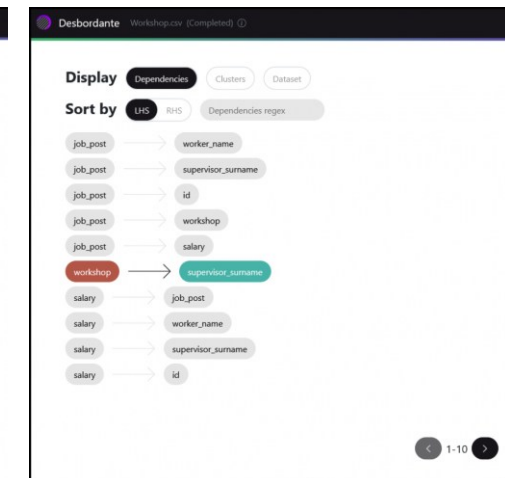

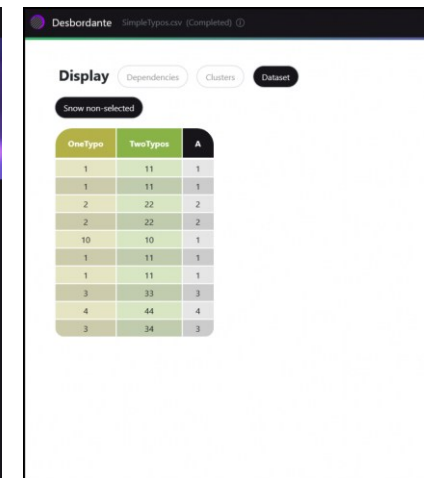

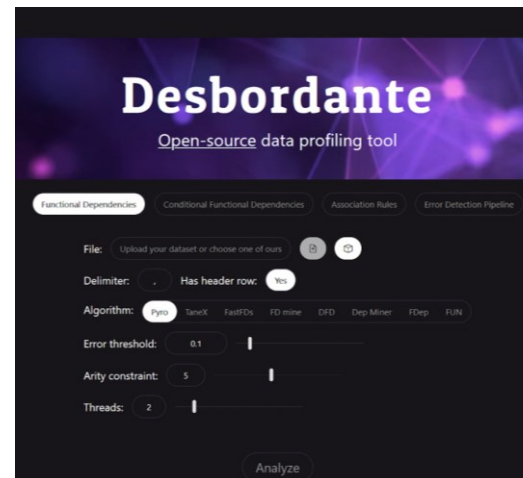

# Functional dependency mining

- **Functional dependency (FD)** – a relationship between two sets of attributes in a relation
  - $X \rightarrow Y$  –  $X$  determines  $Y$ , i.e. there is a many-to-one relationship between the values of the attribute set  $X$  and the values of the attribute set  $Y$
  - $X$  – **determinant**,  $Y$  – **dependent set** (or simply **dependent**)
- Armstrong's Axioms:

Axiom/inference rule	Expression					
Axiom of reflexivity	$X \rightarrow X$					
Axiom of augmentation	IF	$X \rightarrow Y$	THEN	$XZ \rightarrow Y$		
Axiom of transitivity	IF	$X \rightarrow Y$	AND	$Y \rightarrow Z$	THEN	$X \rightarrow Z$
Decomposition rule	IF	$X \rightarrow YZ$	THEN	$X \rightarrow Y$	AND	$X \rightarrow Z$
Union rule	IF	$X \rightarrow Y$	AND	$X \rightarrow Z$	THEN	$X \rightarrow YZ$
Composition rule	IF	$X \rightarrow Y$	AND	$Z \rightarrow V$	THEN	$XZ \rightarrow YV$
Pseudotransitivity rule	IF	$X \rightarrow Y$	AND	$YZ \rightarrow V$	THEN	$XZ \rightarrow V$

# Dependency mining in practice

- **Desbordante** – a high-performance data profiler that is capable of discovering and validating many different patterns in data using various algorithms (<http://desbordante.unidata-platform.ru>)
- Data patterns:
  - Functional dependencies, both exact and approximate (discovery and validation)
  - Conditional functional dependencies (discovery)
  - Metric functional dependencies (validation)
  - Fuzzy algebraic constraints (discovery)
  - Unique column combinations (discovery and validation)
  - Association rules (discovery)

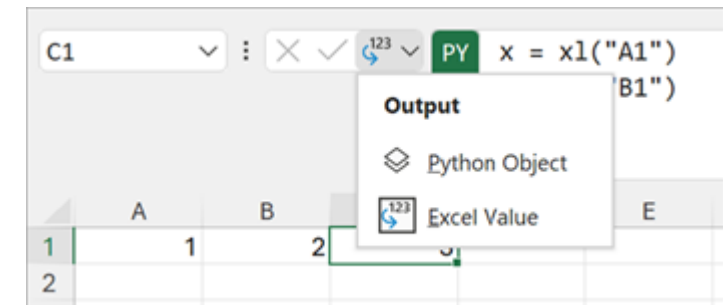

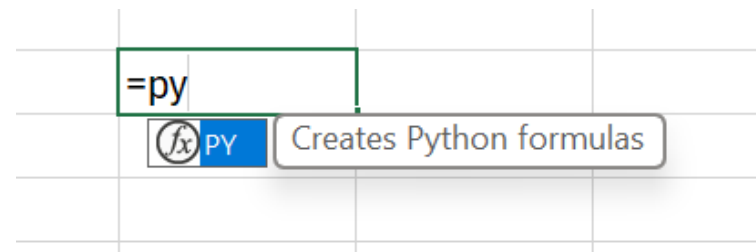

# OBJECT-ATTRIBUTE DATA IN HCI AND UI

- ✓ HCI and UI
- ✓ Tables and spreadsheets
  - ✓ Pivot tables
- ✓ Rows and columns in UI
  - ✓ Implicit and explicit ordering

# Tables in human-computer interaction

- **Spreadsheet** – electronic table with formulas and hyperlinks
- **Lotus 1-2-3** was arguably the application which made the IBM PC a success
- **Microsoft Excel** – industry standard
  - Hierarchy: Workbook → Worksheet → Range → Cell
  - Formula language
  - Now with Python 😊
    - (<http://support.microsoft.com/en-gb/office/get-started-with-python-in-excel-a33fbcbe-065b-41d3-82cf-23d05397f53d>)

# Tables in Microsoft Excel

- 2003 – Lists
- **2007 – Tables**
  - With new access language  
(<http://support.microsoft.com/en-gb/office/using-structured-references-with-excel-tables-f5ed2452-2337-4f71-bed3-c8ae6d2b276e>)
    - Example: =DeptSales[#Totals],[Sales Amount]:[Commission Amount]]
  - **Table** is the successor of **List!**
    - VBA Tables and ListObjects (<http://exceloffthegrid.com/vba-excel-tables-code/>)
- 2013 – New query engine in Power Query
- 2016 – New generation of Data Model (internal DBMS)
  - + Tables access

	Range reference		Structured reference	
		<code>=SUM(B2:B5)</code>		<code>=SUM(Table1[Sales])</code>
	A	B	A	B
1	Item	Sales	Item	Sales
2	Apples	\$100	Apples	\$100
3	Bananas	\$200	Bananas	\$200
4	Lemons	\$150	Lemons	\$150
5	Oranges	\$130	Oranges	\$130
6	Total	\$580	Total	\$580

# Pivot tables – beginning

- 1986 – Pito Salas from Lotus Corp – father of pivot tables
- First implementations:
  - 1991 – Lotus Improv  
([http://en.wikipedia.org/wiki/Lotus\\_Improv](http://en.wikipedia.org/wiki/Lotus_Improv))
  - 1993 – Microsoft Excel 5.x  
(<http://winworldpc.com/product/microsoft-excel/5x>)

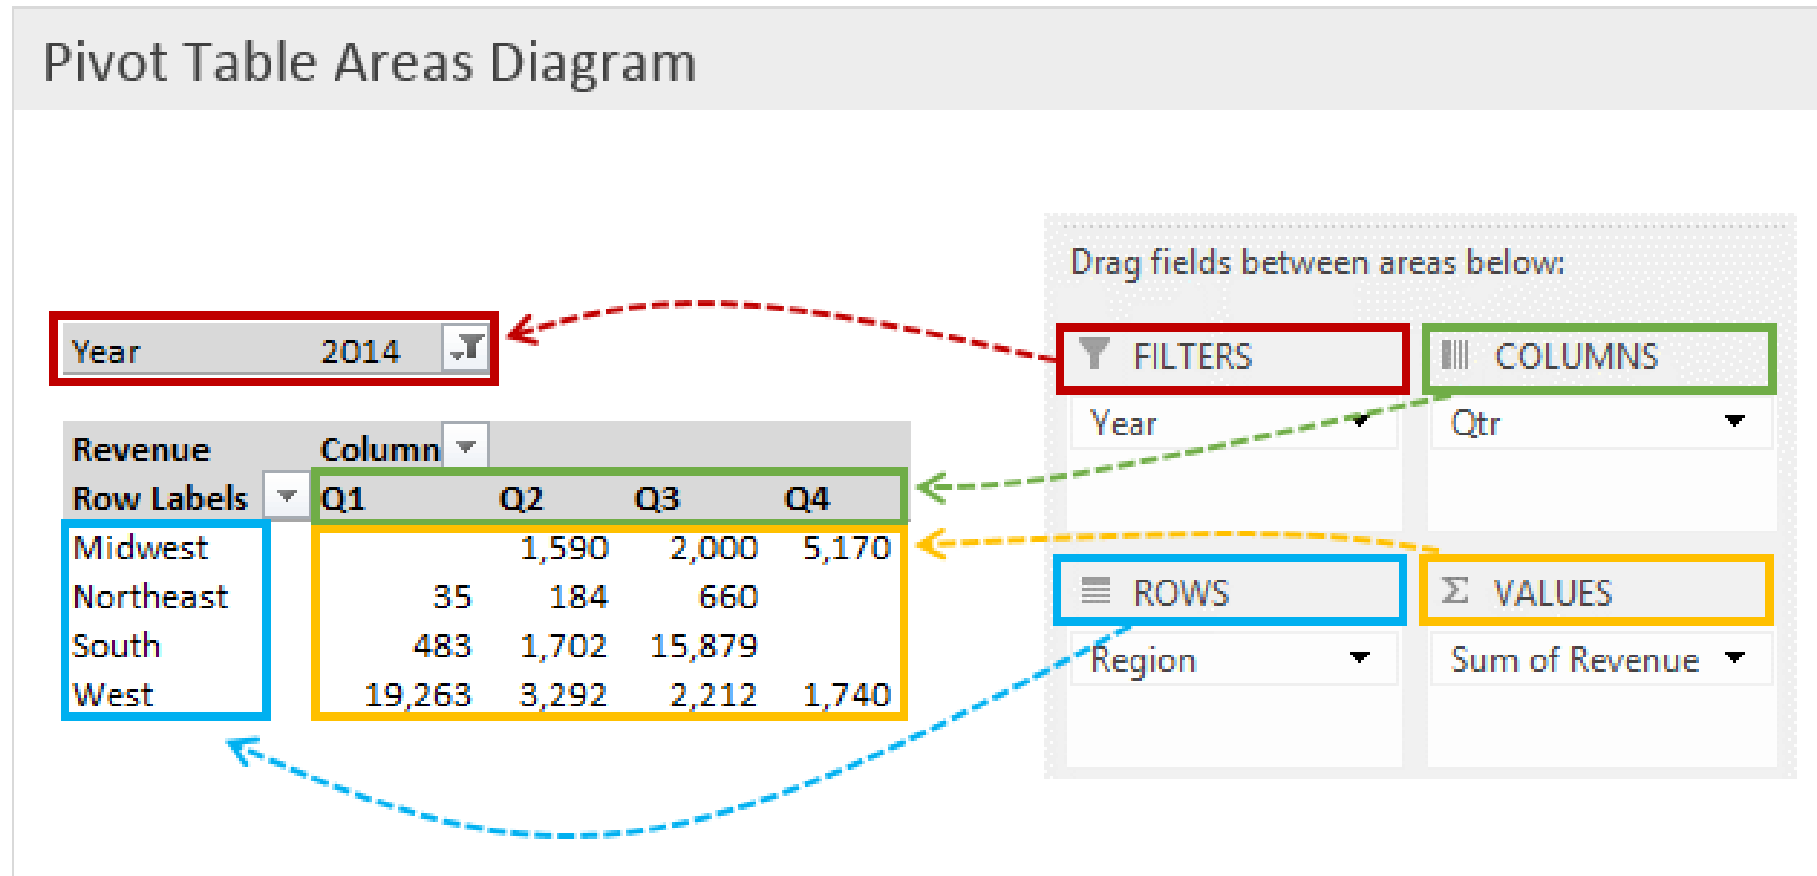

The screenshot displays the Lotus Improv interface. On the left is a menu bar with options: Info, File, Edit, Format, Worksheet, Graph, Print, Services, Hide, and Quit. The main window is titled 'Share • Worksheet — Untitled2' and shows a pivot table with the following data:

Region	Item	1988	1989	1990	1991
Galaxy	Vending	10.01%	8.58%	8.72%	8.84%
	Grocery	4.15%	3.94%	4.36%	4.74%
	Supermarket	0.00%	15.78%	15.87%	15.95%
	All channels	14.16%	28.31%	28.94%	29.53%
Snackers	Vending	10.01%	8.58%	8.72%	8.84%
	Grocery	3.86%	3.48%	3.69%	3.88%
	Supermarket	20.60%	16.47%	15.64%	14.87%
	All channels	34.48%	28.54%	28.04%	27.59%
Mintz	Vending	8.58%	6.96%	6.70%	6.47%
	Grocery	3.00%	2.55%	2.57%	2.59%
	Supermarket	16.60%	13.69%	13.41%	13.15%
	All channels	28.18%	23.20%	22.68%	22.20%
Paydirt	Vending	5.72%	5.10%	5.36%	5.60%
	Grocery	3.15%	3.02%	3.35%	3.66%
	Supermarket	14.31%	11.83%	11.62%	11.42%
	All channels	23.18%	19.95%	20.34%	20.69%
All products	Vending	34.33%	29.23%	29.50%	29.74%
	Grocery	14.16%	12.99%	13.97%	14.87%
	Supermarket	51.50%	57.77%	56.54%	55.39%
	All channels	100.00%	100.00%	100.00%	100.00%

Below the pivot table is a 'Product' and 'Channel' filter section. The main data table on the right is titled 'Worksheet — Untitled2' and shows a grid of data for years 1988-1991 across various categories. At the bottom, a 'Calc' window shows formulas for the pivot table, such as '1. Product-Units:Product/Units:All channels:All regions:All products'.

# Excel Pivot Tutorial

- *How Do Pivot Tables Work?* (<http://www.excelcampus.com/pivot-tables/pivot-tables-work/>)

# Pivot & SQL (addendum for previous topic)

- In SQL language:
  - *Pivot* — Rows to Columns (<https://modern-sql.com/use-case/pivot>)

**Pivot in SQL**

1. Use **GROUP BY** to combine rows
2. Use **FILTER** to pick rows per column

Year	Jan	Feb	Mar	...	Dec
2016	1	23	345	...	1234

Year	Month	Revenue
2016	1	1
2016	2	23
2016	3	345
2016	...	...
2016	12	1234

**modern SQL**

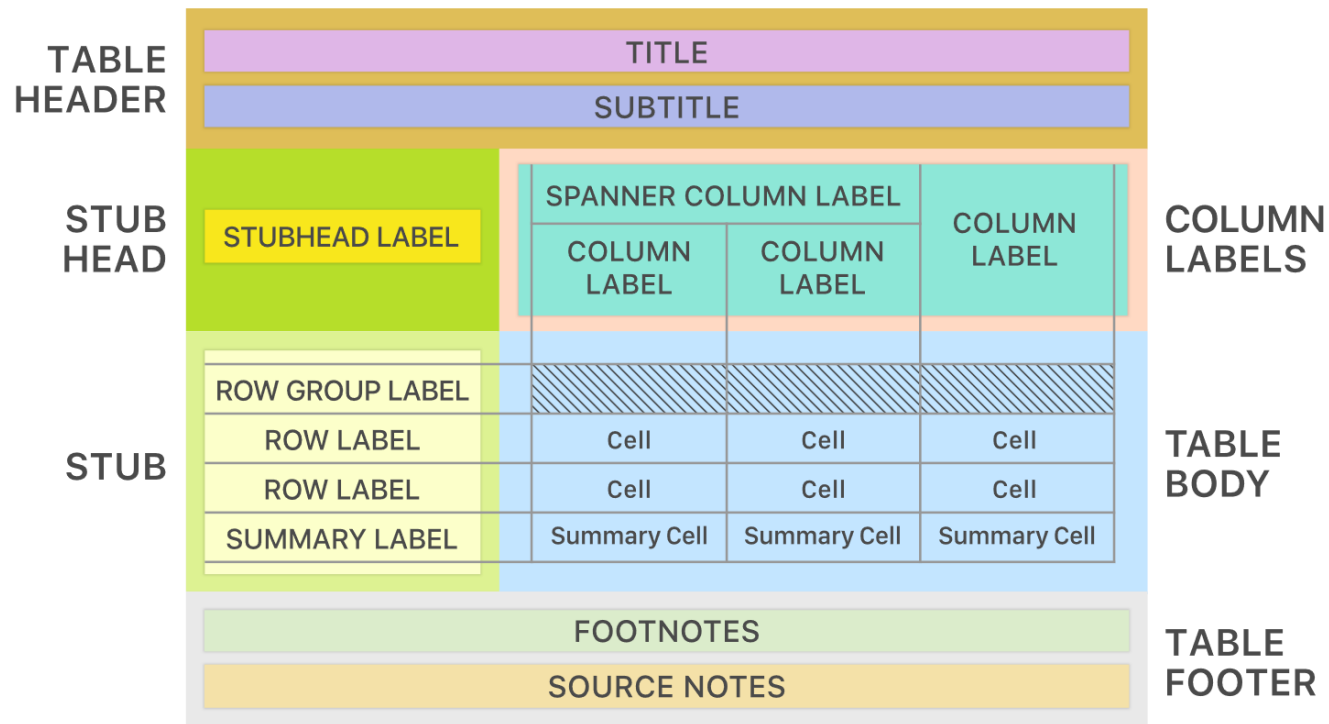

- *Microsoft SQL Server: FROM – Using PIVOT and UNPIVOT*  
(<http://docs.microsoft.com/en-us/sql/t-sql/queries/from-using-pivot-and-unpivot>)

# R – gt (A grammar of tables)

- gt package (<http://gt.rstudio.com>)
  - Constructs a wide variety of useful tables with a cohesive set of table parts:
    - Header, stub, column labels with spanners, body with summary, footer, ...

## The Parts of a gt Table

# OBJECT-ATTRIBUTE DATA IN PROGRAMMING

- ✓ Dataframes and tables
- ✓ Dataframes interoperability
- ✓ Rich table construction and visualization

# Dataframe

- A **tabular data structure** common to many data processing libraries:
  - pandas and other Python libraries
  - The Dataframe API in Apache Spark
  - Data frames in the R programming language
  - ...
- Databricks – What is a DataFrame? (<http://www.databricks.com/glossary/what-are-dataframes>)
  - DataFrame contains a blueprint, known as a schema, that defines the name and data type of each column
  - Missing or incomplete values are stored as null values in the DataFrame

Spreadsheet on a single machine

Table or DataFrame partitioned across servers in a data center

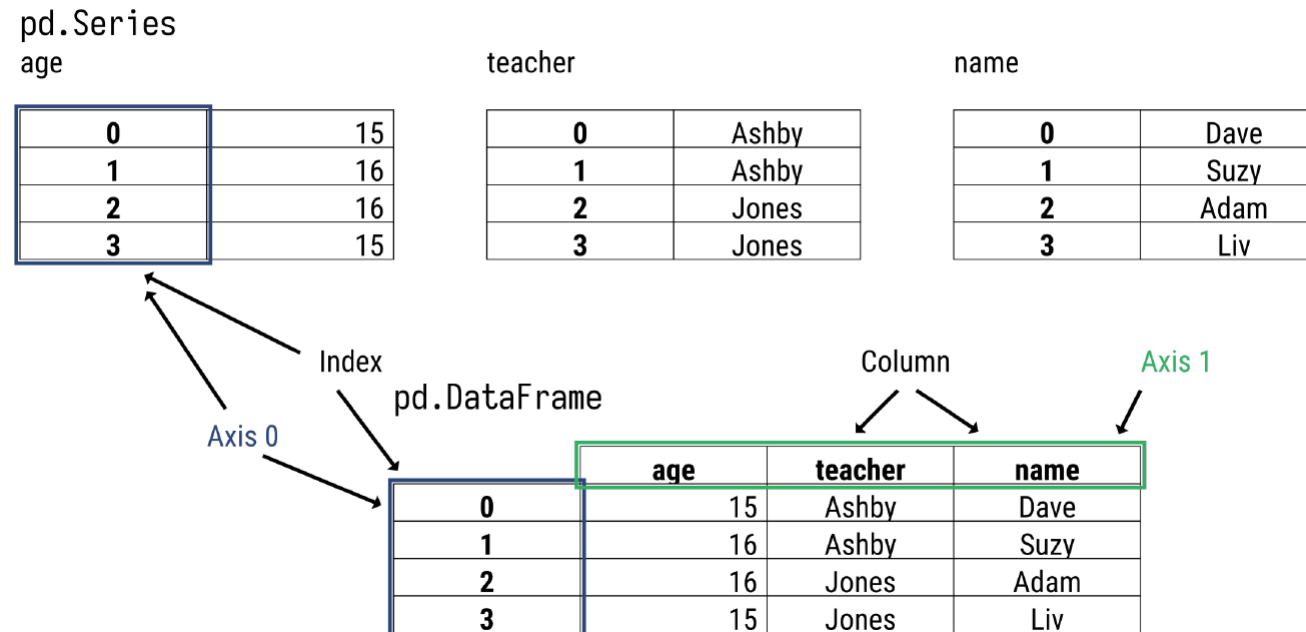

# Python – Pandas

- Harrison M. Effective Pandas. Patterns for Data Manipulation. 2021. 397 p.
  - Series manipulation
  - Creating columns
  - Summary statistics
  - Grouping, pivoting, and cross-tabulation
  - Time series data
  - Visualization
  - Chaining

## Data Structures

# Python – Polars

- **Polars** – Lightning-fast DataFrame library for Rust and Python (<https://www.pola.rs>)

## How Polars will make your life easier

01

### Easy to use

Write your queries the way they were intended. Polars will determine the most efficient way to execute them using its query optimizer.

02

### Embarrassingly parallel

Complete your queries faster! Polars fully utilizes the power of your machine by dividing the workload among the available CPU cores without any additional configuration or serialization overhead.

03

### Apache Arrow

Polars utilizes the Apache Arrow memory model allowing you to easily integrate with existing tools in the data landscape. It supports zero-copy data sharing for efficient collaboration.

04

### Close to the metal

Polars is written from the ground up, designed close to the machine and without external dependencies. This allows for full control of the ecosystem (API, memory & execution).

05

### Written in Rust

The core of Polars is written in Rust, one of the fastest growing programming languages in the world. Rust allows for high performance with fine-grained control over memory.

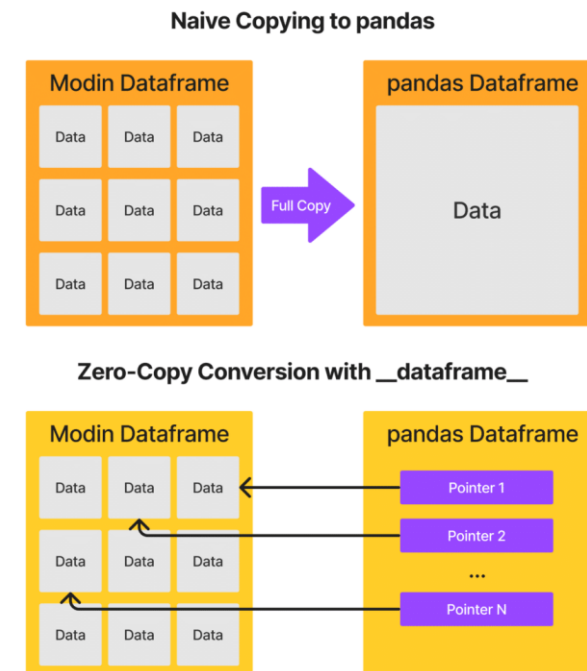

06

### Out of core

Want to process large data sets that are bigger than your memory? Our streaming API allows you to process your results efficiently, eliminating the need to keep all data in memory.

# Python dataframes interoperability

- Consortium for Python Data API Standards (<http://data-apis.org>)
- Dataframe Interchange Protocol ([http://arrow.apache.org/docs/python/interchange\\_protocol.html](http://arrow.apache.org/docs/python/interchange_protocol.html))
- How the Python Dataframe Interchange Protocol Makes Life Better (<http://ponder.io/how-the-python-dataframe-interchange-protocol-makes-life-better/>)
  - Vaex (PR merged 10/13/21)
  - cuDF (PR merged 11/17/21)
  - Modin (PR merged 2/25/22)
  - pandas (PR merged 4/27/22)
  - Polars (PR merged 1/30/23)
  - ibis (PR merged 6/16/23)

# R – data frame

- Timbers T., Campbell T., Lee M. Data Science. A First Introduction. 2023
  - What is a data frame? (<http://datasciencebook.ca/wrangling.html#what-is-a-data-frame>)

		Variable	
region	year	population	
Toronto	2016	2235145	
Vancouver	2016	1027613	Observation
Montreal	2016	1823281	
Calgary	2016	544870	
Ottawa	2016	571146	

Value

- + Tidyverse – R packages for data science (<https://www.tidyverse.org>)

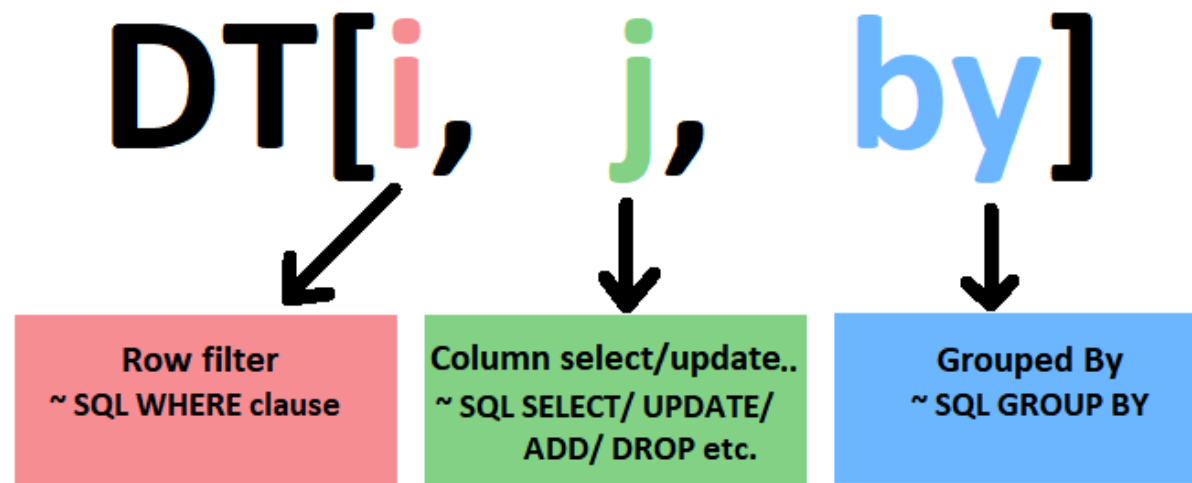

# R – Tables

- `data.table` is an enhanced version of `data.frames`
  - Signorell A. Tables in R – A quick practical overview. 2021  
(<http://cran.r-project.org/web/packages/DescTools/vignettes/TablesInR.pdf>)

## R: Data Table

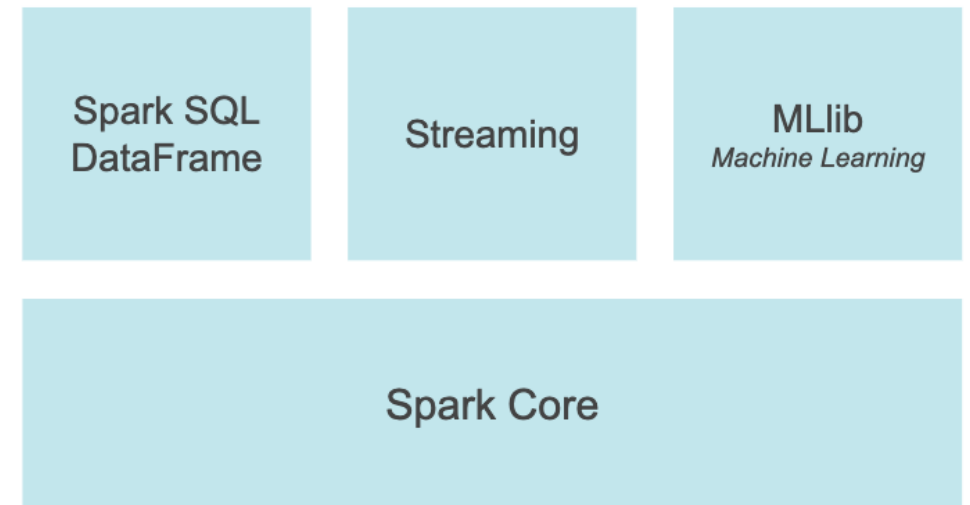

# Spark – DataFrame

- Apache PySpark – `pyspark.sql.DataFrame`

(<http://spark.apache.org/docs/3.1.1/api/python/reference/api/pyspark.sql.DataFrame.html>)

- A DataFrame is a Dataset organized into named columns
- It is conceptually equivalent to a table in a relational database or a data frame in R/Python, but with richer optimizations under the hood

# Terminology drift

- Preventing the Death of the Dataframe (<http://towardsdatascience.com/preventing-the-death-of-the-dataframe-8bca1c0f83c8>)

- Dataframes are losing their statistical computing and machine learning roots:

- Dataframe supports:

- Linear algebra (matrices!)
- Relational algebra (tables!)
- Some cell formulae (spreadsheets!)

Matrix

$$\begin{pmatrix} 0 & 3 & 1 & 0 & 2 & 3 & 8 & 1 & 1 & 3 \\ 1 & 1 & 0 & 0 & 7 & 1 & 2 & 2 & 3 & 3 \\ 1 & 2 & 2 & 0 & 0 & 6 & 7 & 1 & 2 & 2 \\ 1 & 2 & 3 & 10 & 0 & 4 & 6 & 1 & 0 & 5 \\ 3 & 2 & 2 & 1 & 4 & 3 & 2 & 1 & 6 & 0 \\ 7 & 4 & 4 & 5 & 3 & 9 & 6 & 1 & 6 & 1 \\ 7 & 1 & 1 & 5 & 2 & 8 & 9 & 1 & 3 & 6 \\ 5 & 0 & 1 & 6 & 2 & 0 & 0 & 0 & 1 & 5 \\ 1 & 6 & 3 & 3 & 4 & 6 & 2 & 0 & 1 & 1 \\ 1 & 2 & 2 & 4 & 1 & 1 & 3 & 0 & 8 & 2 \end{pmatrix}$$

Relational Table

Name	FName	City	Age	Salary
Smith	John	3	35	\$280
Doe	Jane	1	28	\$325
Brown	Scott	3	41	\$265
Howard	Shemp	4	48	\$359
Taylor	Tom	2	22	\$250

Spreadsheet

The screenshot shows a spreadsheet application with a dashboard. The dashboard includes a donut chart titled 'Portfolio Sectors' and a bar chart titled 'Top 10 of 12 Positions'. The spreadsheet interface shows various data tables and charts.

<i>Obj<sub>p</sub></i>	V	...	V	...	

Label!

# Train, test, and validation sets – cats and dogs

 **MLU-EXPLAIN**    [Introduction](#)    [The Split](#)    [Train Set](#)    [Model](#)    [Validation Set](#)    [Test Set](#)    [Summary](#)

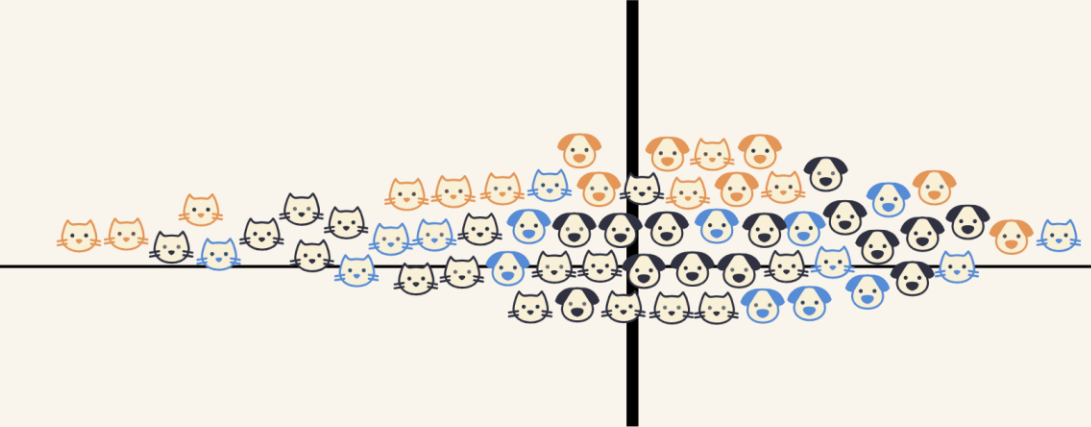

Model Features:  None  Weight  Fluffiness  Both

## The Testing Set

Once we have used the validation set to determine the algorithm and parameter choices that we would like to use in production, the test set is used to approximate the model's true performance in the wild. It is the final step in evaluating our model's performance on unseen data.

**We should never, under any circumstance, look at the test set's performance before selecting a model.**

Peeking at our test set performance ahead of time is a form of overfitting, and will likely lead to unreliable performance expectations in production. It should only be checked as the final form of evaluation, after the validation set has been used to identify the best model.

dataset	feature	# cat right	# cat wrong	# dog right	# dog wrong	accuracy
test	weight	7	2	5	2	75.0%
validation	weight	5	3	6	2	68.8%
